PART I — CONTEXT

1	Project context: what FabStitch is and what this document is for	3
---	--	---

PART II — BUYERS & SEARCH BEHAVIOUR

Q1	Who will be the buyers of FabStitch?	5	Q4	How many keywords could FabStitch potentially target?	11
Q2	What are the subcategories of these buyers?	7	Q5	How many keywords should FabStitch initially target?	12
Q3	What do people search for when they want to buy fabric?	9	Q6	What does “use keywords on every page” actually mean?	14

PART III — TAXONOMY & DATA MODEL

Q7	What are the main fabric categories FabStitch should have?	16	Q9	What applications should FabStitch support?	19
Q8	What fabric specifications should FabStitch support?	17	Q10	How should buyers be connected to fabrics?	21

PART IV — SITE STRUCTURE & PAGE MODEL

Q11	What should the main website navigation categories be?	22	Q14	How can FabStitch reach 30,000–40,000 useful pages?	27
Q12	How many categories should be shown on a page?	24	Q15	What should each individual fabric listing page contain?	29
Q13	How many pages should each category have?	25			

PART V — PAGE TEMPLATES, URLS & DATABASE

Q16	What should a buyer-category page contain?	30	Q18	What should the URL architecture look like?	34
Q17	What should a fabric-category page contain?	33	Q19	How should the database be structured to support this?	36

PART VI — QUALITY CONTROL & PRIORITISATION

Q20	What should determine whether an SEO page becomes indexable?	39	Q23	Which keywords are most valuable for FabStitch?	45
Q21	How should FabStitch avoid thin and duplicate pages?	42	Q24	What should the homepage communicate?	48
Q22	What are the highest-priority keyword groups?	44	Q25	What should the fabric discovery experience look like?	51

PART VII — RECOMMENDATION

3	Recommended FabStitch SEO & marketplace architecture	54
4	FabStitch: from search query to supplier	58

SECTION 1

Project Context

FabStitch is a B2B fabric marketplace that connects fabric suppliers and mills with the businesses that buy fabric — brands, garment manufacturers, home textile producers, sourcing houses and industrial users. This document defines the buyer model, keyword universe, taxonomy, page architecture and quality rules that let the marketplace grow to tens of thousands of pages without ever producing a thin page.

What FabStitch does

Suppliers publish fabric listings. A listing is a structured record — not a blog post — and carries the information a professional buyer needs before requesting a sample or a quote:

fabric_name	material / composition	construction	gsm	width	color
finish	moq	certification	country	price	supplier

Buyers arrive with a manufacturing problem rather than a browsing habit. A t-shirt manufacturer needs 180 GSM combed cotton single jersey at 500 kg minimum from a supplier who can certify OEKO-TEX. An activewear brand needs four-way stretch polyester-spandex with moisture management. A hotel supplier needs 300 thread-count cotton sateen bedding fabric. FabStitch's job is to take that specific need and return matching suppliers and listings quickly.

2 SIDES OF THE MARKETPLACE: SUPPLIERS AND BUYERS	7 CORE ENTITIES: BUYER, APPLICATION, FABRIC, SPEC, COUNTRY, SUPPLIER, LISTING	~40k EVENTUAL INDEXABLE PAGE CEILING, DATA PERMITTING	0 THIN OR DUPLICATE PAGES THIS STRATEGY PERMITS
--	---	---	---

The objective of this document

The commercial goal is to build roughly **30,000–40,000 useful, indexable pages** derived from real marketplace data, so that whatever a fabric buyer types into a search engine, FabStitch has a page that answers it and a supplier who can fulfil it.

THE OBJECTIVE IS NOT MASS PAGE GENERATION

It would be trivial to multiply fabric × GSM × country × buyer type and publish half a million templated pages. That approach fails twice: search engines classify it as doorway or thin content and suppress the whole domain, and buyers bounce from pages with no listings on them.

Every page in the FabStitch architecture must be earned by data. A page exists because there is real supply behind it, real demand in front of it, and something on the page a buyer could not get from the page above it. Page count is an *outcome* of a well-modelled marketplace, never an input target.

The three things people confuse

Throughout this document these are treated as separate systems, and the distinction matters for implementation:

LAYER	SCALE	WHAT IT IS
Keyword database	50,000+ rows	An internal planning table of every query FabStitch might want to rank for, with intent, volume, difficulty and an assigned target URL. Invisible to users. Most rows never get their own page — they get <i>mapped</i> to a page that already exists.
Website pages	All pages built	Every URL the application can render, including filter states, paginated views, internal search results and account pages.
Indexable pages	30,000–40,000	The subset of website pages that pass the data-quality gate in Q20 and are exposed to search engines in sitemaps with a self-referencing canonical.
Marketplace listings	Grows with supply	The real supplier inventory. Listings are the raw material for everything above — as listings grow, previously non-indexable combinations qualify and the indexable set expands automatically.

THE ONE SENTENCE VERSION

FabStitch models the chain **Buyer** → **Application** → **Fabric** → **Specification** → **Country** → **Supplier** → **Listing**, publishes a page at every point on that chain where real data makes the page useful, and maps a large keyword database onto those pages rather than creating a page per keyword.

HOW TO READ THIS DOCUMENT

Sections are written to be handed directly to a developer, designer or SEO lead. Where a number appears — page counts, keyword counts, GSM ranges — it is a **planning figure**: a target for architecture and sizing, not a claim about live search volume. Anything that affects real budget or engineering priority should be validated against keyword research tools and FabStitch's own marketplace data before build.

SECTION 2

Questions & Answers

Twenty-five questions covering buyers, search behaviour, keyword sizing, taxonomy, navigation, page templates, URL design, database structure, indexation rules and the discovery experience. Each answer ends with the implication for the FabStitch website or database.

01 Who will be the buyers of FabStitch?

QUESTION

The complete buyer universe, and why each group needs fabric.

ANSWER

FabStitch's buyer is anyone who converts fabric into a finished product, or who resells fabric to someone who does. That is a wider universe than "clothing brands" — and each group buys with different volumes, specifications and price sensitivity, which is exactly why the site needs buyer-specific pages rather than one generic catalogue.

There are **twelve primary buyer categories**. Each one is a legitimate top-level entity in the database and a legitimate page family on the website.

THE FABSTITCH BUYER UNIVERSE

#	BUYER CATEGORY	WHY THEY NEED FABRIC	TYPICAL ORDER PROFILE
1	Clothing & Fashion Brands	They own the product and the customer but usually not a factory. They select fabric for each season's collection and either buy it themselves or nominate it to their manufacturer.	Small to mid volume, high specification and hand-feel sensitivity, repeat seasonal buying
2	Garment / Clothing Manufacturers	They cut and sew to order for brands. Fabric is their largest input cost, so they buy continuously and competitively against a technical specification.	High volume, price-driven, repeat, MOQ-tolerant
3	Fashion Designers	Independent designers, studios and couture ateliers sourcing distinctive materials in small quantities, plus fabric for samples and prototypes.	Very low volume, low MOQ critical, sample-led, novelty-seeking
4	Private Label Brands	Retailers, marketplaces and Amazon-native sellers producing under their own label. They need reliable, repeatable, certified fabric they can re-order without variation.	Mid volume, consistency and lead time critical, cost-controlled
5	Sportswear & Activewear Brands	Performance is the product. They buy on measurable properties — stretch, recovery, moisture management, UV, weight — not on aesthetics alone.	Mid volume, technical spec-led, test-report driven

#	BUYER CATEGORY	WHY THEY NEED FABRIC	TYPICAL ORDER PROFILE
6	Uniform & Workwear Manufacturers	Contracts for corporate, hospitality, healthcare, school, military and industrial uniforms. Durability, colour fastness and compliance matter more than fashion.	High volume, tender-based, long contracts, strict compliance
7	Home Textile Manufacturers	Bedding, bath, kitchen and table linen. Wide-width fabric, thread count, absorbency and wash durability drive selection.	High volume, wide-width, seasonal retail cycles
8	Furniture & Upholstery Manufacturers	Sofas, chairs, headboards, contract and hospitality furniture. They buy heavyweight fabric rated for abrasion, fire retardancy and rub counts.	Mid to high volume, performance-rated, roll-based buying
9	Bags & Accessories Manufacturers	Backpacks, luggage, totes, caps, belts and pet accessories. Heavy canvas, coated polyester, ripstop nylon, webbing and lining fabrics.	Mid volume, coating and denier-led, hardware-compatible
10	Textile / Fabric Wholesalers & Distributors	They buy fabric to resell — to small factories, retail fabric shops and regional markets. They buy broad and deep rather than to a single specification.	Very high volume, price-first, container-scale, stock-lot buyers
11	Buying Houses & Sourcing Companies	Agents and sourcing offices acting for overseas retailers. They compare many suppliers per enquiry and value structured, comparable data above all else.	Variable volume, multi-supplier RFQs, compliance-heavy
12	Industrial / Technical Textile Companies	Automotive interiors, filtration, geotextiles, medical, packaging, agriculture and protective equipment. They buy against engineering specifications and test standards.	Contract volume, certification-mandatory, long qualification cycles

WHY THIS MATTERS FOR THE WEBSITE

Two buyers can search for the same fibre and need completely different products. "Cotton fabric" from a t-shirt manufacturer means combed cotton single jersey at 160–200 GSM. From a home textile manufacturer it means wide-width percale or sateen. From an upholstery manufacturer it means heavy cotton canvas or duck rated for abrasion.

A single generic "Cotton Fabric" page cannot serve all three well. This is the entire justification for buyer-type pages and for the [Buyer × Fabric](#) page family in Q14.

Each of these twelve is a container, not a leaf. Every one contains many subcategories that buyers actually use to describe themselves — and those subcategory terms are what they type into search engines. Q2 breaks them out.

02

What are the subcategories of these buyers?

QUESTION

A full buyer hierarchy, with the fabric need attached to each branch.

ANSWER

The buyer hierarchy has two levels that matter: the **category** (twelve, from Q1) and the **subcategory** (roughly 100–140 across all categories). The subcategory is the important one commercially, because it is how buyers self-describe and how they search: nobody searches "garment manufacturer fabric", but a great many people search **fabric for hoodie manufacturers**.

BUYER HIERARCHY — THE TWO LEVELS THAT DRIVE PAGES

Buyer Categories

Clothing & Fashion Brands

- Clothing brands · Fashion brands · Streetwear brands
- Luxury brands · Boutique brands · Designer labels
- DTC clothing brands · E-commerce clothing brands
- Sustainable / ethical fashion brands · Kidswear brands · Modest-wear brands

Garment Manufacturers

- T-shirt · Hoodie · Sweatshirt manufacturers
- Shirt · Blouse · Dress manufacturers
- Jeans / denim · Trouser · Jacket manufacturers
- Sportswear · Activewear · Underwear · Loungewear manufacturers

Home Textile Manufacturers

- Bedding · Towel · Curtain manufacturers
- Table linen · Kitchen textile manufacturers
- Hotel & hospitality linen suppliers

The table below is the working hierarchy for all twelve categories. It is the reference a developer should seed the **buyer_categories** table from, and the third column is what makes each buyer page genuinely different from the next.

COMPLETE BUYER HIERARCHY AND FABRIC NEED

MAIN BUYER CATEGORY	BUYER SUBCATEGORIES	EXAMPLE FABRIC NEED
Clothing & Fashion Brands	Clothing brands · Fashion brands · Streetwear brands · Luxury brands · Boutique brands · DTC brands · E-commerce clothing brands · Sustainable fashion brands · Kidswear brands · Modest-wear brands	Cotton jersey 160–200 GSM, French terry 280–400 GSM, viscose and rayon woven for drape, organic and recycled options with certification for sustainability claims
Garment / Clothing Manufacturers	T-shirt · Hoodie · Sweatshirt · Shirt · Blouse · Dress · Jeans / denim · Trouser · Jacket · Sportswear · Activewear · Underwear · Loungewear · Sleepwear · Knitwear manufacturers · CMT units	Single jersey, interlock, rib, French terry, fleece, denim 8–14 oz, poplin, twill, shirting — bought by GSM, yarn count and width, with consistent shrinkage control
Fashion Designers	Independent designers · Couture ateliers · Bridal designers · Costume designers · Sampling & prototyping studios · Fashion students and small studios	Silk, chiffon, organza, satin, crepe, lace, jacquard, velvet — small cuts, low MOQ, swatch and sample availability essential
Private Label Brands	Retail private label · Marketplace sellers (Amazon / Shopify) · Supermarket apparel · White-label suppliers · Corporate merch brands · Promotional apparel	Repeatable, certified, consistent-lot fabric: combed cotton jersey, CVC and poly-cotton blends, brushed fleece — reliability and lead time over novelty
Sportswear & Activewear Brands	Athleisure brands · Gym & fitness apparel · Yoga wear · Running apparel · Cycling apparel · Team & club kit · Swimwear brands · Compression wear · Outdoor apparel	Polyester-spandex and nylon-spandex 4-way stretch, interlock and jersey knits, micro-mesh, recycled polyester, moisture-wicking and UPF-rated finishes
Uniform & Workwear Manufacturers	Corporate uniforms · Hospitality & chef wear · Healthcare scrubs · School uniforms · Security & military · Industrial workwear · Hi-vis & PPE · Aviation uniforms	Poly-cotton twill and gabardine 190–320 GSM, ripstop, drill, flame-retardant and anti-static finishes, hi-vis fluorescent, high colour fastness for industrial laundering
Home Textile Manufacturers	Bedding · Bed sheet · Duvet & quilt · Towel · Bathrobe · Curtain & drapery · Table linen · Kitchen textiles · Hotel & hospitality linen · Baby bedding	Wide-width (240–320 cm) cotton percale and sateen by thread count, terry 350–600 GSM, blackout and voile curtain fabric, polyester microfibre
Furniture & Upholstery Manufacturers	Sofa & seating · Chair · Headboard & bed frame · Contract & hospitality furniture · Office furniture · Outdoor furniture · Automotive seating · Marine upholstery	Heavy chenille, boucle, velvet, linen blends, cotton duck 300–600 GSM, solution-dyed acrylic for outdoor, rated by Martindale rub count and fire-retardancy standards
Bags & Accessories Manufacturers	Backpack · Luggage · Tote & shopper · Laptop bag · Sports bag · Cap & headwear · Belt & strap · Pet accessories · Promotional bags	Cotton canvas 8–20 oz, coated polyester 600D–1680D, ripstop nylon, PU and PVC-coated fabric, webbing, lining taffeta, water-repellent finishes
Textile / Fabric Wholesalers	Fabric wholesalers · Fabric distributors · Regional stockists · Retail fabric shops · Online fabric retailers · Stock-lot and surplus traders · Importers & exporters	Broad range in volume: greige and PFD fabric, basic jersey, poplin, denim, polyester — plus stock lots and closeouts, bought on price per kg or per metre at container scale
Buying Houses & Sourcing Companies	Buying houses · Sourcing agents · Merchandising offices · Retail sourcing arms · Third-party QA & compliance firms · Trading companies	Whatever the end client specified — the requirement is comparable structured data, verified certification, audited suppliers and documented capacity
Industrial / Technical Textiles	Automotive interiors · Filtration · Geotextiles · Medical & surgical textiles · Packaging & FIBC · Agrotexiles · Protective & FR clothing · Composites · Marine & awning	Non-wovens, high-tenacity polyester and nylon, aramid and FR fabric, PU/PVC laminates, coated and technical meshes — bought to engineering specification and test standard

How this translates into the FabStitch website

- **Two URL levels.** `/buyers/garment-manufacturers/` for the category and `/buyers/t-shirt-manufacturers/` for the subcategory. Subcategories sit at the root of `/buyers/` rather than nested three deep, because the subcategory is the term with commercial search demand and it should have the shortest, cleanest URL.
- **Subcategory pages are the priority build.** Roughly 100–140 buyer subcategory pages, each with genuinely different recommended fabrics, GSM ranges, constructions and certifications. If two buyer pages would end up recommending the same fabrics in the same order, merge them.
- **Buyer type is a first-class field on the listing.** Suppliers tag which buyer types a fabric suits, which is what populates `Buyer × Fabric` pages with real inventory instead of guesswork.
- **Onboarding uses the same taxonomy.** Asking a new buyer "what do you make?" with these exact subcategories lets FabStitch personalise search from the first session and validates which subcategories are worth expanding.

03

QUESTION

What do people search for when they want to buy fabric?

Ten distinct search patterns, and the intent behind each.

ANSWER

Fabric search is not one behaviour. A buyer's query changes shape depending on how far along their sourcing process they are. Early on they search by fabric name; by the time they are ready to place an order they search by specification, certification, MOQ and country. Each pattern below needs a different page type to satisfy it.

THE TEN SEARCH PATTERNS

	SEARCH TYPE	REAL EXAMPLES	PAGE THAT SHOULD RANK
A	Fabric type	cotton fabric · denim fabric · jersey fabric · linen fabric · french terry fabric · satin fabric · ripstop fabric	Fabric category page
B	Wholesale / commercial intent	wholesale fabric · bulk fabric · wholesale cotton fabric · fabric by the roll · buy fabric in bulk · fabric price per kg	Fabric category page with wholesale framing, or a dedicated wholesale variant
C	Application / product	t-shirt fabric · fabric for t-shirts · hoodie fabric · best fabric for hoodies · sportswear fabric · upholstery fabric · curtain fabric	Application page
D	Specification	180 GSM cotton jersey · 220 GSM french terry · 4 way stretch fabric · 60 inch wide cotton fabric · 30s combed cotton · 12 oz denim	Fabric + specification page
E	Supplier	fabric supplier · cotton fabric supplier · fabric suppliers near me · jersey fabric supplier · textile supplier for small brands	Supplier directory or fabric page with supplier list
F	Manufacturer / mill	fabric manufacturer · knitted fabric manufacturer · textile mill · organic cotton fabric manufacturer · denim mill	Supplier / mill directory pages, filtered by capability

	SEARCH TYPE	REAL EXAMPLES	PAGE THAT SHOULD RANK
G	Location	cotton fabric supplier Pakistan · fabric manufacturer Turkey · fabric suppliers in India · denim fabric Bangladesh · jersey fabric Portugal	Country + fabric page, or country supplier page
H	Certification	OEKO-TEX certified fabric · GOTS certified organic cotton · GRS recycled polyester fabric · BCI cotton supplier · REACH compliant fabric	Certification hub and certification-filtered fabric pages
I	Performance	moisture wicking fabric · water resistant fabric · breathable fabric for activewear · anti-pilling fleece · flame retardant fabric · UV protection fabric	Performance-attribute pages, closely tied to applications
J	MOQ / bulk buying	low MOQ fabric supplier · fabric supplier 100 kg minimum · no minimum order fabric · small quantity wholesale fabric · fabric MOQ for startups	MOQ-filtered supplier and listing views

Informational intent versus commercial B2B intent

This distinction decides where FabStitch spends its effort. The same fibre appears in both, but the searcher, the page they need and the value to FabStitch are completely different.

INFORMATIONAL INTENT

- what is french terry
- difference between jersey and interlock
- is polyester breathable
- how to wash linen
- GSM meaning in fabric

Mostly consumers, students and hobbyists. High volume, low conversion. Worth a small number of well-made resource pages — they build topical authority and earn links — but they must never become the bulk of the site.

COMMERCIAL B2B INTENT

- french terry fabric supplier
- 280 GSM french terry wholesale
- french terry manufacturer Pakistan
- GOTS french terry low MOQ
- fabric for hoodie manufacturers

Buyers with a budget and a production deadline. Lower volume per query, but these are the queries where a marketplace with real listings wins against blogs and consumer fabric shops. **This is FabStitch's core territory.**

SIGNALS THAT MARK A QUERY AS COMMERCIAL

The presence of any of these words is a reliable commercial-intent flag and should set `commercial_intent = high` in the keyword database: *supplier, manufacturer, mill, wholesale, bulk, MOQ, price per kg, roll, container, factory, exporter, certified, sourcing, quote, sample* — plus any GSM number, oz weight, yarn count, width in inches or cm, or country name.

04

QUESTION

How many keywords could FabStitch potentially target?

The combinatorial maths — and why the answer is not a licence to build pages.

ANSWER

There is no single fixed number, because the keyword universe is generated rather than discovered. Each attribute FabStitch stores about a fabric is a dimension, and buyers combine dimensions freely. The size of the universe is the product of those dimensions.

KEYWORD DIMENSIONS AVAILABLE TO FABSTITCH

DIMENSION	VALUES	EXAMPLES
Fabric type	~120	cotton, jersey, denim, french terry, poplin, chenille, ripstop
Construction	~30	single jersey, interlock, rib 1×1, twill 3/1, plain weave, sateen, pique
Composition / blend	~60	100% cotton, 95/5 cotton-spandex, CVC 60/40, poly-viscose, 100% recycled PET
Application	~80	t-shirts, hoodies, scrubs, bedding, backpacks, car seats
Buyer type	~130	t-shirt manufacturers, activewear brands, hotel linen suppliers
GSM band	~25	120, 140, 160, 180, 200, 220, 240, 280, 320, 400 GSM
Width	~12	44", 58/60", 72", 220 cm, 240 cm, 280 cm, 320 cm
Finish / treatment	~35	brushed, peached, mercerised, enzyme-washed, calendered, water-repellent
Performance attribute	~25	4-way stretch, moisture wicking, anti-pilling, FR, UPF 50+, blackout
Certification	~20	OEKO-TEX 100, GOTS, GRS, BCI, RWS, REACH, ISO 9001
Country / region	~35	Pakistan, Turkey, India, China, Bangladesh, Portugal, Vietnam
Commercial modifier	~15	supplier, manufacturer, wholesale, bulk, low MOQ, exporter, price

Worked example: how fast this compounds

Take a single realistic query pattern and count the variations it generates.

QUERY PATTERN	DIMENSIONS MULTIPLIED	COMBINATIONS
[fabric] + [commercial modifier]	120 × 15	1,800
[fabric] + [gsm]	120 × 25	3,000
[fabric] + [application]	120 × 80	9,600
[fabric] + [country] + [modifier]	120 × 35 × 15	63,000
[buyer type] + [fabric]	130 × 120	15,600
[gsm] + [composition] + [construction]	25 × 60 × 30	45,000
[fabric] + [gsm] + [country] + [modifier]	120 × 25 × 35 × 15	1,575,000
Theoretical universe across all patterns	—	Millions

So the honest answer to "how many keywords could we target?" is: **hundreds of thousands of plausible phrasings, and millions if you count every four-dimension permutation.** That number is a measure of the data model's richness. It is not a plan.

CRITICAL: DO NOT BUILD A PAGE PER COMBINATION

Of the 1,575,000 combinations in the last row, the overwhelming majority are commercially meaningless. Nobody searches `137 GSM velvet fabric supplier Latvia`, and FabStitch will never have a supplier for it. Publishing it would create a page with zero demand, zero listings and zero unique content — the textbook definition of a doorway page.

A combination earns a page only when it passes the gate in **Q20**: real search intent, real listings behind it, and something unique to say. Everything else lives in the keyword database and is *mapped* to the nearest genuinely useful page.

IMPLEMENTATION NOTE

Generate the combinatorial set programmatically into `keywords` as candidate rows with `page_status = 'candidate'`. Then enrich with search volume and difficulty, score for commercial intent, and only promote a candidate to `'planned'` when a listing count threshold is also met. The generator is cheap; the discipline is in the promotion rules.

05 How many keywords should FabStitch initially target?

QUESTION

A sized, prioritised launch portfolio behind a much larger internal database.

ANSWER

Two numbers, and they are deliberately different:

5,000–15,000

ACTIVE KEYWORD TARGETS — EACH ASSIGNED TO A REAL PAGE WITH AN OWNER

50,000+

INTERNAL KEYWORD DATABASE — CANDIDATES, VARIANTS, MAPPINGS, MONITORING

The **active target set** is what the team works on: every one of these keywords has a page, a primary or secondary role on that page, and a tracked position. The **database** is far larger and mostly passive — it captures variants, records which existing page each variant maps to, and holds candidates waiting for enough listings to justify a page.

Recommended composition of the initial 5,000–15,000

INITIAL KEYWORD PORTFOLIO

KEYWORD GROUP	SHARE	APPROX. COUNT	EXAMPLE TARGETS
Core high-volume fabric terms	3%	150–400	cotton fabric, denim fabric, jersey fabric — competitive, slow to win, but they anchor the taxonomy and pass authority down
High-commercial-intent terms	15%	750–2,200	wholesale cotton fabric supplier, bulk jersey fabric, fabric manufacturer for startups
Application-specific	14%	700–2,100	fabric for t-shirts, best fabric for hoodies, upholstery fabric for sofas
Buyer-specific	12%	600–1,800	fabric for t-shirt manufacturers, fabric supplier for activewear brands, hotel linen fabric supplier
Specification-specific	20%	1,000–3,000	180 GSM cotton jersey, 240 GSM french terry, 12 oz denim fabric, 4 way stretch polyester spandex
Country-specific	11%	550–1,650	cotton fabric supplier Pakistan, fabric manufacturer Turkey, denim fabric India
Certification & performance	8%	400–1,200	GOTS certified organic cotton fabric, OEKO-TEX jersey supplier, moisture wicking fabric supplier
Long-tail & question queries	17%	850–2,550	what GSM is best for t-shirts, low MOQ organic cotton jersey supplier, difference between single jersey and interlock
Total active targets	100%	5,000–15,000	

Phasing — do not launch with 15,000

PHASE 1 300–600 keywords · months 0–3

Top fabric categories, the highest-intent supplier and wholesale terms, and the 10–15 buyer subcategories where FabStitch already has supply. Goal: prove the templates convert before scaling them.

PHASE 2 2,000–4,000 keywords · months 3–9

Full fabric taxonomy, all applications, all buyer subcategories with supply, and the first specification pages for high-demand fabrics (jersey, french terry, denim, twill).

PHASE 3 5,000–15,000 keywords · months 9–24

Country combinations, certification and performance sets, deep specification coverage, and the **Buyer × Fabric** matrix — released only where listing thresholds are met.

THESE ARE PLANNING FIGURES

Every count above is a sizing estimate for architecture and resourcing. Before committing, validate against Ahrefs / Semrush / Google Keyword Planner volumes, Search Console impression data once the site has history, and FabStitch's own on-site search logs — which will be the single best keyword source once traffic exists, because they show what buyers ask for and FabStitch cannot yet supply.

06

QUESTION

What does “use keywords on every page” actually mean?

One primary keyword, a small set of secondaries, and natural supporting language.

ANSWER

It does **not** mean loading every page with dozens of phrases. It means every page has one job — one query it is unambiguously the best answer to — and the language on the page reflects how professionals actually talk about that topic.

THE FIVE LAYERS OF ON-PAGE KEYWORD USE

LAYER	COUNT	ROLE AND PLACEMENT
Primary keyword	Exactly 1	The page's reason to exist. Appears in the title tag, H1, URL slug, meta description, opening sentence, and the image alt of the lead image. One page, one primary — if two pages share a primary keyword, one of them should not exist.
Secondary keywords	3–8	Close commercial variants the same page can legitimately satisfy. Placed in H2s, subheadings, filter labels and body copy — each used once or twice, naturally.
Related terms	10–25	Vocabulary a knowledgeable person would inevitably use: yarn count, shrinkage, bio-wash, open-end vs ring-spun. Their presence is what signals genuine expertise.
Semantic entities	As relevant	Named things the topic connects to: OEKO-TEX Standard 100, GOTS, Faisalabad, Bursa, Martindale, ISO 105. These link the page into the wider knowledge graph.
Search intent	—	Not a phrase at all, but the layout: a buyer searching a specification wants listings, MOQ and price visible immediately, not four paragraphs of prose first.

Complete worked example

180 GSM Cotton Jersey Fabric

/fabrics/cotton/jersey/180-gsm/ · fabric + specification page

PRIMARY KEYWORD

180 GSM cotton jersey fabric — used in title tag, H1, URL, meta description and first sentence. Nowhere else forced.

SECONDARY KEYWORDS (EACH ONCE OR TWICE, IN HEADINGS AND BODY)

180 GSM cotton jersey supplier

180 GSM single jersey fabric

wholesale 180 GSM cotton jersey

180 GSM jersey for t-shirts

combed cotton jersey 180 GSM

180 GSM knit fabric price

RELATED TERMS (NATURAL PROFESSIONAL VOCABULARY)

single jersey construction

30s combed yarn

ring-spun

open-end

tubular / open-width

72 inch width

shrinkage 3–5%

bio-wash finish

reactive dyed

GSM tolerance $\pm 5\%$

MOQ per colour

price per kg

SEMANTIC ENTITIES

OEKO-TEX Standard 100

GOTS

BCI Cotton

Faisalabad

ISO 105-C06 colour fastness

INTENT SATISFIED BY LAYOUT, NOT BY WORDS

A buyer typing this query is mid-sourcing. The page opens with matching listings — supplier, MOQ, width, finish, certification, price band — followed by a short technical explanation of what 180 GSM single jersey suits, then links to 160 GSM and 200 GSM for buyers who realise they need a different weight.

KEYWORD STUFFING — NEVER DO THIS

- "Buy 180 GSM cotton jersey fabric. Our 180 GSM cotton jersey fabric is the best 180 GSM cotton jersey fabric from 180 GSM cotton jersey fabric suppliers..."
- Hidden keyword blocks, footer lists of 200 city names, or repeated H2s that all say the same thing
- Targeting 180 gsm jersey and jersey 180 gsm with two separate pages

WHAT GOOD LOOKS LIKE

- One clear primary keyword in the places that matter, then written for a sourcing manager
- Variants consolidated onto one strong page instead of split across weak duplicates
- The page's real value — live listings, real specifications, real suppliers — doing most of the ranking work

PRACTICAL RULE FOR THE TEMPLATE

Store `primary_keyword` and `secondary_keywords[]` as fields on the SEO page record. The template injects the primary into title, H1 and meta automatically; secondaries feed H2 labels. Everything else on the page comes from real listing and supplier data, which is why the copy stays natural without anyone hand-writing 30,000 pages.

07 What are the main fabric categories FabStitch should have?

QUESTION

A complete fabric taxonomy, organised two ways: by name and by classification.

ANSWER

Fabric needs **two parallel classifications**, because buyers use both. Some buyers search by the fabric's common name (`french terry`), others by its class (`knitted fabric` , `natural fibre fabric` , `sustainable fabric`). Both must resolve to a page.

Classification 1 — the named fabric taxonomy

These are the primary category names, each becoming a top-level fabric page. Fabrics are grouped by the family a buyer would recognise.

NAMED FABRIC TAXONOMY — 30 PRIMARY CATEGORIES

FAMILY	PRIMARY CATEGORIES	TYPICAL SUB-TYPES THAT BECOME CHILD PAGES
Cotton & cotton-based	Cotton · Denim · Poplin · Twill · Canvas · Muslin · Lawn · Voile · Flannel · Corduroy	Combed, carded, organic, recycled, mercerised, slub, PFD/ greige, ring-spun, open-end, enzyme-washed, stretch denim, selvedge denim
Knits	Jersey · Interlock · Rib · Pique · French Terry · Fleece · Terry · Mesh	Single jersey, double jersey, rib 1×1 and 2×2, brushed and unbrushed French terry, micro-fleece, polar fleece, sherpa, honeycomb mesh, birdseye
Wovens & suiting	Gabardine · Jacquard · Ripstop · Oxford · Drill · Sateen	Plain, twill 2/1 and 3/1, herringbone, dobby, brocade, damask, matt jacquard, 210T-1680D coated wovens
Fine & drapey	Silk · Satin · Chiffon · Crepe · Organza · Velvet · Georgette	Mulberry silk, charmeuse, duchess satin, crepe de chine, crushed and stretch velvet, silk-blend organza
Bast, wool & protein	Linen · Wool · Hemp · Jute · Ramie	Pure and blended linen, merino, lambswool, worsted, tweed, boiled wool, cashmere blends, hemp-cotton
Synthetics & regenerated	Polyester · Nylon · Spandex blends · Acrylic · Viscose / Rayon · Modal · Lyocell · Cupro · Acetate	Recycled polyester (rPET), micro-polyester, nylon 6 and 6.6, poly-spandex 4-way, bamboo viscose, TENCEL™ lyocell, poly-viscose suiting

Classification 2 — the cross-cutting classification

These are filters and hub pages that cut across the named taxonomy. A fabric belongs to several of them at once — 95/5 organic cotton-elastane single jersey is simultaneously a natural-fibre blend, a knit, a stretch performance fabric and a sustainable fabric.

BY FIBRE ORIGIN		BY CONSTRUCTION & PURPOSE	
Natural fibres	Cotton, linen, hemp, jute, ramie, silk, wool, cashmere, alpaca	Knits	Jersey, interlock, rib, pique, terry, fleece, mesh, warp knit, tricot
Regenerated	Viscose, rayon, modal, lyocell / TENCEL™, cupro, acetate, bamboo viscose	Wovens	Plain, twill, satin/sateen, jacquard, dobby, oxford, canvas, denim
Synthetic	Polyester, nylon, acrylic, elastane / spandex, polypropylene, aramid	Non-wovens	Spunbond, meltblown, needle-punched, interlining, geotextile
Blended	CVC, poly-cotton, cotton-spandex, poly-viscose, wool-poly, cotton-linen, tri-blend	Performance	4-way stretch, moisture-wicking, water-repellent, FR, anti-microbial, UPF, blackout
		Sustainable	Organic (GOTS), recycled (GRS/RCS), BCI, deadstock, low-impact dyed, biodegradable

IMPLEMENTATION: ONE FABRIC, MANY LABELS

Model this as a **primary hierarchy plus tags**, not as a single tree. Each fabric has one canonical parent (cotton → jersey → single jersey) which defines its URL, plus many-to-many tags for fibre origin, construction class, performance attributes and sustainability. Hub pages such as /fabrics/knitted/ or /fabrics/sustainable/ are generated from tags and canonicalise to themselves, while individual fabrics always live at their one canonical URL. This prevents the same fabric existing at three competing addresses.

08 What fabric specifications should FabStitch support?

QUESTION The full specification schema, and how each field behaves as a filter.

ANSWER

Specifications are the heart of the product. They are what makes a listing comparable, what powers filtering, and what generates the most commercially valuable pages. Each field below needs a defined type, a unit, and a decision about whether it filters, facets, or merely displays.

SPECIFICATION SCHEMA AND FILTER BEHAVIOUR

FIELD	TYPE	EXAMPLE VALUES	FILTER BEHAVIOUR	SEO ROLE
Composition	Structured %	100% cotton · 95% cotton 5% elastane · 60/40 CVC	Multi-select + fibre % range	Page-generating
Material / fibre	Taxonomy	Cotton, polyester, viscose, nylon, wool	Multi-select	Primary category

FIELD	TYPE	EXAMPLE VALUES	FILTER BEHAVIOUR	SEO ROLE
Construction	Taxonomy	Single jersey, interlock, rib 1×1, twill 3/1, sateen	Multi-select	Page-generating
GSM	Integer	120 · 160 · 180 · 220 · 280 · 400	Range slider + preset bands	Page-generating
Width	Decimal + unit	58/60" · 72" · 240 cm · 280 cm	Range + tubular/ open-width toggle	Facet only
Yarn count	Structured	20s · 30s · 40s · 30/1 combed · 150D/48F	Multi-select	Facet / long-tail
Stretch	Enum + %	None · 2-way · 4-way · 15% elongation	Multi-select	Page-generating
Stretch direction	Enum	Warp · Weft · Bi-directional	Sub-filter of stretch	Facet only
Finish	Multi-tag	Bio-wash · Brushed · Peached · Mercerised · Calendered	Multi-select	Long-tail pages
Dyeing	Enum	Reactive · Pigment · Vat · Yarn-dyed · Piece-dyed · PFD/greige	Multi-select	Facet only
Printing	Enum	Digital · Rotary · Screen · Sublimation · None	Multi-select	Facet only
Colour	Taxonomy + hex	White · Black · Navy · Custom to Pantone	Swatch multi-select	Display + variant
Pattern	Taxonomy	Solid · Stripe · Check · Floral · Camo · AOP	Multi-select	Facet only
Shrinkage	Range %	≤3% · 3–5% · 5–8%	Max-threshold filter	Trust signal
Pilling resistance	Grade	Grade 3 · 3–4 · 4 · 4–5 (ISO 12945)	Min-threshold filter	Trust signal
Colour fastness	Grade	Wash 4 · Rubbing 3–4 · Light 4 (ISO 105)	Min-threshold filter	Trust signal
Moisture wicking	Boolean + test	Yes / No · AATCC 195 result	Toggle	Page-generating
Water resistance	Enum + rating	DWR · PU coated · 3,000 mm · 10,000 mm	Multi-select + range	Page-generating
Breathability	Rating	CFM · g/m ² /24h MVTR	Range	Facet only
UV resistance	Rating	UPF 30+ · UPF 50+	Multi-select	Page-generating
Certification	Multi-tag + doc	OEKO-TEX 100 · GOTS · GRS · BCI · REACH	Multi-select, verified only	Page-generating
MOQ	Number + unit	100 kg · 500 kg · 1,000 m · per colour	Max-threshold filter	Page-generating

FIELD	TYPE	EXAMPLE VALUES	FILTER BEHAVIOUR	SEO ROLE
Price	Range + currency	\$2.80–3.40 / kg · \$1.20 / m	Range slider	Display + sort
Country of origin	Taxonomy	Pakistan · Turkey · India · China · Portugal	Multi-select	Page-generating

How these fields behave in the marketplace filter

TIER 1 — ALWAYS VISIBLE

Material, construction, GSM, MOQ, country, certification, price. These are the seven filters a sourcing manager reaches for first, so they sit open in the sidebar by default.

TIER 2 — COLLAPSED

Width, yarn count, stretch, finish, dyeing, colour, pattern, printing. Expanded on demand; they narrow a result set that is already relevant.

TIER 3 — TECHNICAL PANEL

Shrinkage, pilling, colour fastness, breathability, MVTR, water column, UPF. Grouped as "Test & performance data" — decisive for technical buyers, noise for everyone else.

THREE RULES THAT KEEP SPECIFICATIONS USABLE

- 1. Structured, never free-text.** "180 gsm", "180 GSM", "approx 180" and "175–185" must all normalise to an integer with a tolerance field. Free-text specs destroy filtering, comparison and page generation simultaneously.
- 2. Units are explicit and convertible.** Store canonical SI plus the supplier's entered unit. Show GSM and oz/yd², inches and centimetres, price per kg and per metre — buyers in different regions think in different units and will abandon a page that speaks the wrong one.
- 3. Only some fields generate pages.** The "SEO role" column above is deliberate: GSM, composition, construction, certification, MOQ and country generate pages. Colour, pattern and printing stay as filters — navy 180 GSM cotton jersey is a variant, not a page, and treating it as one is how sites accumulate tens of thousands of near-duplicates.

09 What applications should FabStitch support?

QUESTION

The end-product taxonomy — the way buyers actually think about fabric.

ANSWER

An application is the finished product the fabric becomes. This is the most natural entry point into the marketplace, because a buyer knows with certainty what they are making and often only approximately what fabric they need.

APPLICATION TAXONOMY

APPLICATION GROUP	APPLICATIONS	FABRICS TYPICALLY REQUIRED
Tops & casualwear	T-shirts · Polo shirts · Hoodies · Sweatshirts · Shirts · Blouses · Knitwear	Single jersey 140–200 GSM, pique 180–220, French terry 240–320, fleece 280–400, poplin and oxford shirting 100–140
Bottoms & outerwear	Jeans · Trousers · Chinos · Shorts · Jackets · Coats · Vests	Denim 8–14 oz, twill and drill 200–320 GSM, gabardine, canvas, ripstop, quilted and laminated shells
Dresses & occasion	Dresses · Skirts · Bridal · Eveningwear · Abayas & modest wear	Crepe, chiffon, satin, georgette, silk, viscose woven, lace, jacquard, organza
Performance apparel	Sportswear · Activewear · Yoga wear · Running · Cycling · Swimwear · Compression · Team kit	Poly-spandex and nylon-spandex 4-way 180–280 GSM, micro-interlock, birdseye mesh, recycled polyester, chlorine-resistant swim knits
Intimates & sleep	Underwear · Bras · Loungewear · Sleepwear · Thermals	Micro-modal jersey, cotton-elastane rib, tricot, warp-knit lace, brushed poly-spandex
Uniform & workwear	Uniforms · Workwear · Scrubs · Chef wear · School uniforms · Hi-vis · Coveralls · PPE	Poly-cotton twill 190–320 GSM, drill, gabardine, FR-treated cotton, anti-static blends, fluorescent polyester
Home textiles	Bedding · Bed sheets · Duvet covers · Towels · Bathrobes · Curtains · Table linen · Kitchen textiles	Wide-width percale and sateen by thread count, terry 350–600 GSM, microfibre, blackout, voile, waffle weave
Furniture & interiors	Upholstery · Sofas · Chairs · Headboards · Cushions · Outdoor furniture · Wall panels	Chenille, boucle, velvet, heavy linen blends, cotton duck 300–600 GSM, solution-dyed acrylic, FR-backed upholstery
Bags, footwear & accessories	Bags · Backpacks · Luggage · Totes · Caps · Belts · Footwear uppers · Linings	Canvas 8–20 oz, coated polyester 600D–1680D, ripstop nylon, PU/PVC laminates, webbing, taffeta lining, mesh
Technical & industrial	Medical textiles · Industrial textiles · Automotive textiles · Filtration · Geotextiles · Agrotexiles · Packaging & FIBC · Marine & awning	Non-wovens, high-tenacity polyester and nylon, aramid, coated technical mesh, laminates, woven polypropylene

Why application-based discovery matters so much

IT MATCHES HOW BUYERS THINK

A buyer never wakes up wanting 180 GSM single jersey. They want to make a t-shirt that feels right at a target cost. Application pages let FabStitch translate a *product* intent into a *specification*, which is exactly the expertise a marketplace should supply.

IT CAPTURES HUGE SEARCH DEMAND

Queries in the form **fabric for [product]** and **best fabric for [product]** are among the highest-volume commercial queries in the industry, and they are usually answered badly — by blogs with no inventory behind them.

IT TEACHES WHILE IT SELLS

An application page can legitimately carry genuinely useful content: recommended GSM ranges, the trade-offs between constructions, common mistakes. That content is real value, which is what keeps these pages out of the thin-content category.

IT IS THE BRIDGE IN THE DATA MODEL

Application is the join between buyer and fabric. Without it, connecting "hoodie manufacturers" to "320 GSM brushed French terry" requires hard-coded rules. With it, the relationship is data and both sides can grow independently.

10

How should buyers be connected to fabrics?

QUESTION

The Buyer → Application → Fabric → Specification → Listing chain.

ANSWER

Buyers should never be connected directly to fabrics. They are connected **through the application they manufacture**, and from the application to specification and finally to real listings. This single design decision is what makes the whole architecture scalable instead of hand-maintained.

THE CORE RELATIONSHIP CHAIN

Three worked examples

EXAMPLE 1 — T-SHIRT MANUFACTURERS

T-Shirt Manufacturers

T-Shirts (application)

Cotton Jersey · Combed Cotton Jersey · Cotton-Elastane Jersey · Tri-blend Jersey

160 GSM — lightweight, summer tees, higher yield per kg

180 GSM — the industry default, best balance of feel and cost

200 GSM — premium and heavyweight tees, better print surface

Supplier listings filtered by MOQ, certification, country, price

EXAMPLE 2 — SPORTSWEAR BRANDS

Sportswear Brands

Sportswear / Activewear

Polyester-Spandex · Nylon-Spandex ·
Micro-Mesh · Recycled rPET

4-way stretch, 180–260 GSM, moisture
wicking, UPF 50+

Test reports: AATCC 195, ISO 12945

Supplier listings with performance data

EXAMPLE 3 — HOME TEXTILE MANUFACTURERS

Home Textile Manufacturers

Bedding

Cotton Percale · Cotton Sateen · Poly-
Cotton · Linen Blend

Width 240–320 cm, TC 200–400,
reactive dyed

OEKO-TEX 100, shrinkage ≤3%

Supplier listings wide-width capable
mills only

How this lives in the database

The chain is expressed as three join tables plus one scoring field. Nothing is hard-coded in the application layer.

JOIN TABLE	RELATIONSHIP	KEY FIELDS AND PURPOSE
buyer_application	many-to-many	buyer_category_id, application_id, relevance — a hoodie manufacturer maps strongly to hoodies and weakly to sweatshirts
application_fabric	many-to-many	application_id, fabric_id, suitability_score, recommended_gsm_min/max, notes — this is where FabStitch's domain expertise is stored as data
listing_application	many-to-many	listing_id, application_id — supplier-declared and system-inferred, so listings surface on the right application pages

THE PAYOFF

Because the relationship is data, a `Buyer × Fabric` page such as `/buyers/t-shirt-manufacturers/cotton-jersey/` can be generated automatically: pull the buyer, follow it to its applications, follow those to suitable fabrics, pull the recommended GSM band, then fill the page with live listings that match. Add a new supplier and dozens of pages improve without anyone editing them. Add a new buyer subcategory and it inherits the whole fabric map immediately.

11 What should the main website navigation categories be?

QUESTION

Six primary sections, and what sits inside each.

ANSWER

FabStitch should use **six primary navigation sections**. Each corresponds to a real entity in the data model, which means navigation, URL structure and database all agree with each other — the single biggest predictor of whether a large site stays coherent as it grows.

PRIMARY NAVIGATION

SECTION	ANSWERS THE QUESTION	WHAT APPEARS INSIDE
Fabrics	"I know the material I need"	Fibre families (cotton, polyester, viscose, linen, wool, silk, nylon, blends), construction classes (knits, wovens, non-wovens), and cross-cutting hubs (performance fabrics, sustainable fabrics, stretch fabrics). Ends with a link to the full A-Z fabric index.
Applications	"I know what I'm making"	The ten application groups from Q9, each showing its 4–8 highest-demand applications: t-shirts, hoodies, shirts, dresses, jeans, sportswear, swimwear, uniforms, scrubs, bedding, towels, curtains, upholstery, bags, technical textiles.
Buyers	"I am a..."	The twelve buyer categories from Q1, each expanding to its highest-value subcategories. Doubles as the self-identification path used in onboarding.

SECTION	ANSWERS THE QUESTION	WHAT APPEARS INSIDE
Suppliers	"Who can make this?"	Browse by country, by capability (knitting, weaving, dyeing, printing, finishing), by certification, by MOQ band, by verification status. Plus the join-as-supplier entry point.
Certifications	"Can this pass compliance?"	OEKO-TEX Standard 100, GOTS, GRS, RCS, BCI, RWS, REACH, ISO 9001, plus what each covers, what documentation looks like, and certified suppliers and fabrics for each.
Resources	"Help me decide"	GSM guides, fabric comparison guides, sourcing and MOQ guides, glossary, unit converters, incoterms and lead-time explainers, country sourcing overviews.

DO NOT HIDE HIGH-VALUE CATEGORIES BEHIND "VIEW MORE"

A collapsed mega-menu that reveals only six fabrics and hides the rest behind a "View more" toggle costs FabStitch twice: buyers do not find the category, and the internal link that would have passed authority to it either does not exist in the HTML or sits behind JavaScript.

Rule: every category expected to be a significant traffic or revenue driver must be reachable as a real, crawlable `<a href>` in the rendered mega-menu — not injected on click. "View all" is for the long tail, never for the head.

MEGA-MENU STRUCTURE — FABRICS

BY FIBRE

- Cotton
- Polyester
- Viscose / Rayon
- Linen
- Wool
- Silk
- Nylon
- Blends

BY CONSTRUCTION

- Jersey
- Interlock
- French Terry
- Fleece
- Denim
- Twill
- Poplin
- Canvas

BY PROPERTY

- Stretch fabrics
- Performance fabrics
- Sustainable fabrics
- Certified fabrics
- Heavyweight
- Lightweight
- **View all fabrics** →

The same three-column pattern applies to Applications (by group), Buyers (by category) and Suppliers (by country / capability / certification), giving a consistent menu grammar across the site.

12

How many categories should be shown on a page?

QUESTION

Per-template limits, and when to use “View all”.

ANSWER

The working range is **10–30 categories per page**. Below ten a page feels like a dead end; above thirty buyers stop reading and start scanning, and the internal link value spreads too thin to matter. The exact number depends on the template.

RECOMMENDED CATEGORY COUNTS BY TEMPLATE

PAGE TYPE	CATEGORIES SHOWN	WHAT TO SHOW, AND IN WHAT ORDER
Homepage	18–24	8–12 top fabrics, 6–8 top applications, 4–6 buyer types. Chosen by commercial value and available supply, not alphabetically. Everything else reached via navigation and the index pages.
Main category hub (/fabrics/, /applications/)	25–30	The complete set of primary children with a short description and listing count each. This page's job is comprehensive linking, so it is allowed to be the densest page on the site.
Fabric category page (/fabrics/cotton/)	10–20	Child fabric types first (jersey, poplin, twill, canvas), then GSM bands, then related applications, then countries. Grouped under clear subheadings rather than one long list.
Buyer category page	10–15	Recommended fabrics ranked by suitability, plus related applications and adjacent buyer types. Curated deliberately — a buyer page that links to 40 fabrics has given no advice.
Application page	12–18	Suitable fabrics grouped by construction, recommended GSM bands, then buyer types that make this product.
Supplier category page	15–25	Supplier cards paginated at 20–24 per page, plus filter entry points for capability, certification and MOQ band.
Listing page	6–12	Related fabrics, alternative GSMs, same-supplier listings, and the applications this fabric suits. Enough to keep the buyer moving, not enough to distract from the enquiry button.

When to use “View all”

USE VIEW ALL WHEN

- The full set exceeds ~30 items and the tail has genuinely low demand
- It links to a real, crawlable index page — not a JavaScript expansion
- The head of the list is already visible above it
- Sorting the full list serves a purpose (A–Z fabric index, all countries, all certifications)

DO NOT USE VIEW ALL WHEN

- It hides top-tier commercial categories such as cotton, jersey or denim
- It is the only path to a page — every indexable page needs a static link somewhere
- It merely expands a client-side accordion with no separate URL
- It is used to avoid deciding what matters most on the page

A USEFUL ORDERING RULE

Rank category links by **listing count × commercial intent**, not alphabetically. A category with 400 live listings and high buyer intent deserves the first position on every page it appears on; a category with three listings should be far down or absent until supply improves. This makes the site self-optimising as inventory changes.

13

QUESTION

How many pages should each category have?

Depth is decided by data, not by symmetry.

ANSWER

Categories should be **asymmetric by design**. Cotton might justify 400 descendant pages; ramie might justify one. Forcing every category to the same depth is exactly how thin pages get created. Depth follows two inputs only: *is there search demand*, and *is there supply*.

Worked example — how Cotton branches

COTTON: FROM CATEGORY TO SPECIFICATION TO COUNTRY

Cotton — /fabrics/cotton/

- Cotton Jersey** /fabrics/cotton/jersey/
 - Single Jersey · Double Jersey · Slub Jersey · Cotton-Elastane Jersey
 - GSM pages:** 140 · 160 · 180 · 200 · 220 · 240 GSM
 - Country pages:** 180 GSM cotton jersey — Pakistan · India · Turkey · Bangladesh

- Cotton Interlock · Cotton Rib · Cotton Pique** — each with its own GSM band pages

- Cotton Poplin · Cotton Twill · Cotton Canvas** — weight in GSM or oz, plus width variants

- Organic Cotton · Combed Cotton · Mercerised Cotton · Recycled Cotton** — quality and treatment tiers, each crossing into the constructions above

ILLUSTRATIVE DEPTH BY CATEGORY — PLANNING FIGURES

FABRIC CATEGORY	CHILD TYPES	SPEC PAGES	COUNTRY PAGES	TOTAL DEPTH	JUSTIFICATION
Cotton	10	70	60	~140	Highest demand, widest supply, most GSM-sensitive
Jersey / knits	8	55	40	~105	Core apparel fabric, very GSM-driven
Denim	6	30	25	~60	Strong demand, weight in oz, country reputation matters
Polyester	9	45	30	~85	Broad synthetic base, performance variants
Linen	4	14	10	~30	Moderate demand, fewer meaningful weights
Velvet	3	6	4	~13	Niche, mostly aesthetic rather than spec-driven
Ramie	1	0	0	1	Very low demand and supply — one page is correct

When a country-level page is worth building

Country pages are valuable when the country is genuinely part of the buying decision — and for fabric it very often is, because sourcing regions have real reputations, price levels and lead times. But they are also the easiest place to create duplicates.

- ✓ **Build it** when the country has a recognised association with the fabric — Pakistan and cotton knits and denim, Turkey and jersey and towelling, India and cotton and viscose, Portugal and premium jersey, China and technical synthetics.

- ✓ **Build it** when there are at least 5–10 live listings from suppliers in that country for that fabric, so the page has real inventory.
- ✓ **Build it** when there is something specific to say: typical MOQ levels, lead times, common certifications, port and shipping realities, price positioning.
- ✗ **Skip it** when the page would be the fabric page with a country name swapped into the headline. That is the definition of a doorway page.
- ✗ **Skip it** for every country in a list of 195. Start with the 12–20 real textile sourcing countries and expand only with supply.

14

QUESTION

How can FabStitch eventually reach 30,000–40,000 useful pages?

The programmatic page model, page by page type, with a release sequence.

ANSWER

By building **nine page families**, each generated from a different combination of the core entities, and releasing each family only as far as the data supports it. The total is an architecture ceiling, not a launch requirement.

PROGRAMMATIC PAGE MODEL

PAGE TYPE	GENERATED FROM	APPROX. PAGES	WHAT MAKES EACH PAGE UNIQUE
Fabric pages	fabric	2,000	Different material, construction, properties, use cases, price level and supplier set
Fabric specification pages	fabric × gsm / composition / construction	5,000	A specific technical variant with its own weight, hand-feel, yield, applications and price
Application pages	application	2,000	Different end product with its own fabric shortlist, GSM guidance and construction advice
Buyer pages	buyer_category / subcategory	1,000	Different buyer profile: volumes, MOQ tolerance, certifications, priorities
Buyer + Fabric pages	buyer × fabric	5,000	The specific fit between one buyer type and one fabric — recommended specs, common mistakes, matched listings
Country + Fabric pages	country × fabric	3,000	Regional supply reality: mills, MOQ norms, lead times, price bands, certifications, ports
Supplier pages	supplier	2,000	A real company: capabilities, machinery, capacity, certifications, full listing catalogue

PAGE TYPE	GENERATED FROM	APPROX. PAGES	WHAT MAKES EACH PAGE UNIQUE
Individual listing pages	listing	15,000	A real, purchasable product with unique specs, MOQ, price, availability and lead time
Other useful pages	guides, certifications, comparisons, glossary, indexes	5,000	Editorial and reference value: GSM guides, fabric-vs-fabric comparisons, sourcing guides
Total architecture ceiling		~40,000	

THESE ARE PLANNING TARGETS, NOT A BUILD ORDER

Nothing here says "generate 40,000 pages". It says the data model is capable of supporting roughly 40,000 pages *if and when* listings, suppliers and demand justify them. A FabStitch with 800 listings should have roughly 1,500–2,500 indexable pages. The indexable count should trail the listing count, never lead it.

Recommended release sequence

STAGE	TRIGGER	INDEXABLE PAGES	PAGE FAMILIES RELEASED
Stage 1	Launch, 200–1,000 listings	500–2,500	Fabric pages · Application pages · Buyer pages · Supplier pages · Listing pages · core guides
Stage 2	2,000–5,000 listings	4,000–10,000	Adds fabric specification pages for the top 20 fabrics, plus the first Country × Fabric set for the main sourcing countries
Stage 3	8,000–15,000 listings	15,000–25,000	Adds the Buyer × Fabric matrix, deep specification coverage, certification-filtered pages, comparison and guide expansion
Stage 4	15,000+ listings, mature supply	30,000–40,000	Full matrix wherever thresholds are met; continuous automated pruning of pages that fall below threshold

PAGES MUST BE ABLE TO SHRINK AS WELL AS GROW

Build the indexation gate as a nightly job, not a one-time migration. If a Country × Fabric page drops from twelve listings to one because a supplier left, it should automatically fall back to `noindex` and redirect its internal links to the parent fabric page. A programmatic system without automated pruning becomes a thin-content problem within a year.

15

QUESTION

What should each individual fabric listing page contain?

The most valuable template on the site, in full.

ANSWER

The listing page is the only page on FabStitch that represents something a buyer can actually transact on. It should be structured like a technical data sheet with a commercial call to action, not like a product description.

180 GSM Cotton Jersey — Combed, Bio-Washed

Listing #FS-24817 · /listings/180-gsm-cotton-jersey-combed-fs-24817/

CORE SPECIFICATION

MATERIAL 100% Cotton	CONSTRUCTION Single Jersey	GSM 180 (±5%)
WIDTH 72 in / 183 cm	YARN COUNT 30s combed ring-spun	FINISH Soft / bio-washed
COLOUR White + 42 stock shades	DYEING Reactive	SHRINKAGE 3–5%
MOQ 500 kg	CERTIFICATION OEKO-TEX 100	COUNTRY Pakistan

COMMERCIAL TERMS

PRICE \$3.05–3.30 / kg	AVAILABILITY In production	LEAD TIME 18–25 days
SAMPLE Swatch free · 3 m paid	CAPACITY 40 t / month	INCOTERMS FOB Karachi · EXW

COMPLETE LISTING PAGE STRUCTURE

BLOCK	CONTENTS AND PURPOSE
Header	Fabric name written as a buyer would search it, listing reference, supplier name with verification badge, country flag, price band and MOQ visible without scrolling
Media	Fabric photography (flat, draped, macro weave/knit detail), colour swatch grid, optional short video showing drape and stretch
Core specification	Every field from Q8 that the supplier has provided, in a fixed order so buyers can compare listings side by side
Test & performance data	Shrinkage, pilling grade, colour fastness, moisture management, water column, UPF — with the test standard named. Uploaded reports linked where available
Commercial terms	Price band with unit, MOQ per colour and per order, monthly capacity, lead time, incoterms, payment terms, sample policy and cost

BLOCK	CONTENTS AND PURPOSE
Supplier information	Company profile, years in operation, machinery and capabilities, certifications with expiry dates, response time, review or transaction history, other listings
Applications	"Commonly used for" — t-shirts, polo shirts, loungewear — each linking to the application page. Populated from <code>listing_application</code>
Buyer suitability	"Well suited to" — t-shirt manufacturers, private label brands, DTC brands — linking to buyer pages. The reverse of the Q10 chain
Related fabrics	Alternative GSMs (160, 200), alternative constructions (interlock, pique), alternative compositions (cotton-elastane), and comparable listings from other suppliers
Actions	Request quote · Request sample · Add to comparison · Add to enquiry list · Message supplier · Order (where supported). Persistent on scroll
Structured data	Product schema with <code>additionalProperty</code> for each specification, <code>Offer</code> for price band and availability, <code>Organization</code> for the supplier, <code>BreadcrumbList</code> for the path

WHY THESE PAGES ARE VALUABLE TO BUYERS

Everything needed to make a shortlist decision is on one page, in the same format as every other listing. No email thread, no PDF request, no waiting for a specification sheet. Comparability is the product.

WHY THEY ARE VALUABLE TO SEARCH ENGINES

Each one is unique by construction — different supplier, specs, price, MOQ, lead time and photography. They target hyper-specific long-tail queries, carry rich structured data, and are the deepest, most authentic content on the domain. Fifteen thousand listing pages are fifteen thousand genuinely distinct documents, which is why this family is the largest in the model.

GUARDRAILS ON LISTING PAGES

Require a minimum data completeness score before a listing becomes indexable — for example material, construction, GSM, width, MOQ, country and at least one image. Listings below that threshold stay live for logged-in buyers but carry `noindex`, and suppliers see a completeness prompt. This aligns supplier incentives with page quality instead of policing it after the fact. Sold-out or withdrawn listings should be kept, marked unavailable, and linked to live alternatives rather than deleted into 404s.

16

QUESTION

What should a buyer-category page contain?

Worked in full for T-shirt manufacturers, then applied to four more buyer types.

ANSWER

A buyer-category page answers one question: *"I make this — what fabric should I buy, and who can supply it?"* It is part advice, part shortlist, part supplier directory. The advice is what makes it unique; the listings are what make it convert.

Fabric for T-Shirt Manufacturers

/buyers/t-shirt-manufacturers/ · buyer subcategory page

1 · INTRODUCTION

Two to four paragraphs written for a production or sourcing manager: what t-shirt manufacturers buy, how weight drives both hand-feel and cost per garment, why yarn quality matters more than fibre marketing, and what typically goes wrong — GSM tolerance, shrinkage after wash, and lot-to-lot shade variation.

2 · COMMON FABRIC REQUIREMENTS

The buying profile as a scannable block: knitted fabric, 140–220 GSM, tubular or open-width, combed or carded depending on price tier, consistent shrinkage, reactive dyed with high wash fastness, MOQ typically 300–1,000 kg per colour.

3 · RECOMMENDED FABRICS — RANKED, NOT LISTED

FABRIC	GSM BAND	WHY, AND WHEN TO CHOOSE IT
Combed cotton single jersey	160–200	The default for quality tees — smoother surface, less pilling, better print result
Carded cotton single jersey	160–200	Lower cost, slightly rougher hand — promotional and high-volume basics
Cotton-elastane jersey (95/5)	180–220	Fitted and women's styles needing recovery
Tri-blend / CVC jersey	150–180	Softer drape, vintage look, better wrinkle recovery, lower shrinkage
Slub / bamboo-viscose jersey	140–180	Premium and elevated basics where drape sells the product

4 · RECOMMENDED GSM — WITH THE TRADE-OFF EXPLAINED

[140–160](#) lightweight, summer, best yield per kg · [180](#) the industry default · [200–220](#) premium and heavyweight, best print surface, higher fabric cost per unit. Each links to its specification page.

5 · RECOMMENDED CONSTRUCTIONS

Single jersey as standard; interlock for a smoother double-faced finish; 1×1 rib for collars and cuffs; pique where a polo variant is in the range.

6 · COMMON CERTIFICATIONS

OEKO-TEX Standard 100 as the baseline buyers expect, GOTS where organic is claimed on the label, GRS/RCS for recycled content, BCI for cotton sustainability programmes — each linked to its certification page with an explanation of what documentation to request.

7 · SUPPLIER LISTINGS

Live, filtered listings matching this buyer profile — pre-filtered to knits at 140–220 GSM — with MOQ, price band, country, certification and lead time visible, sortable and comparable.

8-10 · RELATED FABRICS · RELATED APPLICATIONS · RELATED BUYER TYPES

Related fabrics (interlock, French terry, pique), related applications (polo shirts, tank tops, kidswear), and adjacent buyer types (private label brands, DTC brands, promotional apparel) — internal linking that helps buyers who mis-identified their own category.

The same template applied to four other buyer types

The structure stays constant; the content in every block changes completely. That is the test of a legitimate programmatic template.

TEMPLATE APPLIED ACROSS BUYER TYPES

BUYER TYPE	RECOMMENDED FABRICS	GSM / WEIGHT	CERTIFICATIONS EMPHASISED	WHAT THE PAGE MUST GET RIGHT
Sportswear manufacturers	Poly-spandex 4-way, nylon-spandex, micro-interlock, birdseye mesh, recycled rPET knits	180–280 GSM	OEKO-TEX, GRS, bluesign®	Performance data is the deciding factor: stretch and recovery %, moisture management test results, UPF rating, anti-pill grade. Test reports must be visible on listings.
Home textile manufacturers	Cotton percale, cotton sateen, poly-cotton, terry, microfibre, linen blends	TC 200–400; terry 350–600 GSM	OEKO-TEX, GOTS, BCI	Width is the gate — 240/280/320 cm capability filters out most apparel mills. Thread count and absorbency replace GSM as the primary metric for sheeting and towelling.
Fashion brands	Viscose woven, crepe, satin, silk blends, linen, premium jersey, jacquard	90–220 GSM	OEKO-TEX, GOTS, RWS, FSC viscose	Low MOQ and sample availability matter more than price per kg. Hand-feel, drape and colour accuracy need strong photography and swatch ordering.
Workwear manufacturers	Poly-cotton twill, drill, gabardine, ripstop, FR-treated cotton, hi-vis polyester	190–320 GSM	OEKO-TEX, EN ISO 11612, EN 20471, EN 1149	Compliance is non-negotiable — standards, test certificates and industrial-wash durability outrank aesthetics entirely. Long contract volumes and repeat-lot consistency.

THE UNIQUENESS TEST FOR BUYER PAGES

Before publishing, put two buyer pages side by side. If the recommended fabrics, GSM guidance, certifications and warnings are substantially the same, the two buyer types are commercially identical and should be one page with two entry keywords — not two pages competing with each other.

17

QUESTION

What should a fabric-category page contain?

Worked in full for "Cotton Fabric".

ANSWER

A fabric-category page has to serve two audiences at once: a buyer who knows exactly which cotton variant they want and needs to get to listings in one click, and a buyer who only knows "cotton" and needs to be routed to the right variant. Structure it so the first buyer never has to read and the second buyer is guided.

Cotton Fabric

/fabrics/cotton/ · fabric category page

1 · INTRODUCTION

What cotton is used for commercially, the difference between carded, combed, organic, recycled and mercerised, and how cotton behaves versus blends on shrinkage, breathability, print receptivity and cost. Written to be genuinely informative — this is the block that earns the page its right to exist alongside the listings.

2 · TYPES OF COTTON FABRIC

Plus quality tiers as their own entries: combed, carded, organic (GOTS), recycled, mercerised, BCI, slub, PFD/greige. Each is a child page with real listings behind it.

3 · APPLICATIONS

T-shirts, hoodies, shirts, dresses, jeans, uniforms, bedding, towels, upholstery, bags — each linking to the application page, each annotated with the cotton variant it usually needs.

4 · SPECIFICATIONS AVAILABLE ON FABSTITCH

Live facet summary generated from inventory: composition options, constructions, GSM range, widths, yarn counts, finishes, dye methods — with a count of listings behind each value so buyers can see where the supply actually is.

5 · GSM RANGES — WITH MEANING ATTACHED

GSM	TYPICAL CONSTRUCTION	USED FOR
100–140	Voile, lawn, light jersey	Shirting, linings, summer tops, kidswear
140–180	Single jersey, poplin	T-shirts, blouses, light dresses
180–240	Jersey, interlock, pique, twill	Premium tees, polos, trousers, uniforms
240–320	French terry, drill, canvas	Sweatshirts, hoodies, workwear, bags

GSM	TYPICAL CONSTRUCTION	USED FOR
320–600	Fleece, duck, terry towelling	Heavy hoodies, upholstery, towels, bathrobes

6 · CONSTRUCTIONS · 7 · CERTIFICATIONS

Knit constructions (single jersey, interlock, rib, pique, terry, fleece) and woven constructions (plain, twill, sateen, jacquard) with a one-line explanation of each. Certifications section covering OEKO-TEX 100, GOTS, BCI, RCS, and what each proves.

8 · SUPPLIERS · 9 · AVAILABLE LISTINGS

Verified cotton suppliers with country, capability and MOQ band, followed by the live listing grid with the standard filter set. Listings, not prose, occupy the majority of the page.

10 · RELATED FABRICS · 11 · BUYER CATEGORIES

Adjacent materials (linen, hemp, CVC blends, bamboo viscose, recycled cotton) and the buyer types who buy cotton most — closing the Buyer ↔ Fabric loop from both directions.

12 · FAQs

- What GSM cotton is best for t-shirts?
- What is the difference between combed and carded cotton?
- How much does cotton fabric shrink, and how is it controlled?
- What is a typical MOQ for cotton fabric, and can it be lowered?
- Is organic cotton worth the price premium?
- Which countries are best for sourcing cotton fabric, and why?

ORDERING PRINCIPLE

Put a compact filter bar and the listing grid **above** the long-form explanation, with the introduction reduced to two or three sentences at the top and expanded lower down. Buyers with commercial intent must not scroll past 800 words of education to reach inventory. The full text still lives on the page — just below the point of action. FAQs use `FAQPage` structured data; the category itself uses `CollectionPage` with `ItemList`.

18

What should the URL architecture look like?

QUESTION

A clean, readable, hierarchical scheme — plus rules for the awkward cases.

ANSWER

Six top-level directories, matching the six navigation sections and the six core entity families. Depth is limited to four segments; anything deeper becomes a filter parameter instead.

URL SCHEME	
/fabrics/	All fabric categories — the fabric hub
/fabrics/cotton/	Fabric category
/fabrics/cotton/jersey/	Fabric sub-type
/fabrics/cotton/jersey/single-jersey/	Construction variant
/fabrics/cotton/jersey/180-gsm/	Specification page
/fabrics/cotton/jersey/180-gsm/pakistan/	Specification × country
/applications/	All applications
/applications/t-shirts/	Application page
/applications/hoodies/	Application page
/buyers/	All buyer types
/buyers/t-shirt-manufacturers/	Buyer subcategory
/buyers/sportswear-brands/	Buyer subcategory
/buyers/t-shirt-manufacturers/cotton-jersey/	Buyer × fabric
/suppliers/	Supplier directory
/suppliers/pakistan/	Suppliers by country
/suppliers/pakistan/knitted-fabric/	Country × capability
/suppliers/al-noor-textiles-fs1042/	Individual supplier profile
/listings/180-gsm-cotton-jersey-combed-fs-24817/	Individual listing
/certifications/oeko-tex-standard-100/	Certification hub
/resources/gsm-guide-for-t-shirts/	Guide / editorial

The logic behind these choices

DECISION	REASONING
Six top-level directories only	URL structure mirrors navigation and the data model. A developer, an SEO and a buyer can all predict where any page lives, and analytics segments cleanly by directory.
Buyer subcategories sit at /buyers/{sub}/	The subcategory is the term with commercial search demand, so it gets the shortest URL. Nesting it under the parent category would add depth for no user or search benefit.
GSM appears as a directory, not a parameter	/180-gsm/ is an indexable page with real demand; ?gsm=180 signals a filter state. Only specification values in the page-generating list from Q8 earn a directory.
Country appends as the last segment	Country narrows an existing page rather than reclassifying it, so it belongs at the end. It also keeps /fabrics/ as the single source of truth for fabric pages instead of splitting inventory across country folders.
Listings and suppliers carry an ID suffix	Slug plus stable ID keeps URLs readable while guaranteeing uniqueness for two suppliers with similar names, and lets the slug be regenerated without breaking the URL.

DECISION	REASONING
Maximum four segments	Beyond four the combination is almost never commercially meaningful. Colour, pattern, width and price become query parameters on a <code>noindex</code> filter state.

Rules for filters, parameters and duplicates

- 1 Lowercase, hyphenated, no stop words.** `/fabrics/cotton/jersey/180-gsm/` — never underscores, camel case, or `/fabrics/the-best-cotton-jersey/`.
- 2 Trailing slash consistently,** with a 301 from the non-slash version. Pick one and enforce it at the edge.
- 3 Filter states use query parameters** and are `noindex, follow` with a canonical to the clean parent — except where a filter combination has been explicitly promoted to a real directory page.
- 4 Pagination uses `?page=2`**, self-canonicalising, indexable, with the first page as the canonical entry point in sitemaps.
- 5 One canonical home per entity.** A fabric that appears under a tag hub (`/fabrics/sustainable/`) still canonicalises to its hierarchical URL.
- 6 Never encode ephemeral state in a path.** Sort order, currency, unit preference and session data stay in parameters or cookies, never in the URL.
- 7 Slug changes 301, never break.** Keep a `url_history` table so every retired slug redirects permanently to its current URL.

19 How should the database be structured to support this SEO system?

QUESTION

Entities, relationships and the fields that drive page generation.

ANSWER

Thirteen core entities in three groups: the **taxonomy layer** (what things are), the **marketplace layer** (real supply), and the **SEO layer** (what gets published). Critically, the SEO layer is separate — pages are records, not code branches, so page state can change nightly without a deployment.

ENTITY RELATIONSHIPS

Taxonomy layer

Marketplace layer

SEO layer

The **keywords** table

keywords		
FIELD	TYPE	PURPOSE
keyword	text, unique	The query as a buyer types it
search_intent	enum	informational · commercial · transactional · navigational
buyer_category	fk, nullable	Buyer dimension, if the query implies one
fabric_category	fk, nullable	Fabric dimension
application	fk, nullable	Application dimension
composition	text, nullable	Fibre composition implied by the query
construction	fk, nullable	Construction implied by the query
gsm	int, nullable	Weight implied by the query
width	decimal, nullable	Width implied by the query
finish	text, nullable	Finish or treatment implied
certification	fk, nullable	Certification implied
country	fk, nullable	Sourcing country implied
search_volume	int, nullable	From keyword tools; null until researched
keyword_difficulty	int 0–100	Competitive difficulty
commercial_intent	enum / score	low · medium · high — the primary prioritisation field
page_type	enum	fabric · spec · application · buyer · buyer_fabric · country_fabric · supplier · listing · guide
target_url	text	The page that owns this keyword — many keywords share one URL
indexable	boolean	Whether the target page is exposed to search engines
page_status	enum	candidate · planned · published · noindex · merged · retired

WHY THE SEO LAYER MUST BE ITS OWN TABLE

If indexation logic lives in template code, changing it means a release. If it lives in `seo_pages`, a nightly job recomputes `listing_count`, `completeness` and `indexable` for every row, regenerates the sitemap from `indexable = true`, and the site self-corrects as supply moves. This one decision is what separates a programmatic SEO system that stays healthy at 40,000 pages from one that quietly rots.

Additional fields worth carrying on **seo_pages**

page_type	url	primary_keyword	secondary_keywords[]	title_tag
meta_description	h1	intro_content	listing_count	supplier_count
country_count	data_completeness	uniqueness_score	indexable	canonical_url
parent_page_id	schema_type	last_generated_at	last_reviewed_at	page_status

20

QUESTION

What should determine whether an SEO page becomes indexable?

A seven-condition gate, with thresholds and an INDEX / NOINDEX decision framework.

ANSWER

A page becomes indexable only when it passes **all seven conditions** below. This is the single most important control in the entire architecture: it is what allows FabStitch to plan for 40,000 pages without ever publishing a thin one.

THE SEVEN CONDITIONS

#	CONDITION	MEASURABLE THRESHOLD	WHY IT MATTERS
1	Relevant search intent exists	At least one keyword mapped with <code>commercial_intent</code> ≥ medium, or measurable volume, or on-site search demand	A page nobody searches for cannot earn traffic and only dilutes crawl budget
2	Real listings exist	Fabric / application / buyer pages: ≥ 3 live listings . Specification, buyer × fabric, country × fabric pages: ≥ 5 live listings	Listings are what make the page useful. A category page with one product is a dead end for buyers and a thin page for search engines
3	Useful information exists	≥ 150 words of specific, non-templated content, plus a populated specification or guidance block	The page must tell a buyer something they could not infer from the URL
4	The page has unique value	<code>uniqueness_score</code> ≥ 0.7 against its parent and its nearest siblings	Prevents 180 GSM and 185 GSM existing as two near-identical pages
5	It is not a duplicate variant	No sibling page shares its primary keyword; colour, pattern and minor width variants excluded by rule	Duplicate variants split authority and cause the pages to compete with each other

#	CONDITION	MEASURABLE THRESHOLD	WHY IT MATTERS
6	Enough supplier / marketplace depth	≥ 2 distinct suppliers (≥ 3 for country pages), with average listing completeness ≥ 70%	A single supplier behind a page makes it a supplier ad, not a marketplace category — and it disappears if that supplier leaves
7	The combination is commercially meaningful	Passes the rule set: fabric × spec ✓, fabric × country ✓, buyer × fabric ✓ — fabric × colour ✗, spec × spec ✗	Stops the combinatorial explosion from Q4 at the point of publication

INDEX / NOINDEX decision framework

WORKED DECISIONS

CANDIDATE PAGE	LISTINGS	SUPPLIERS	DECISION	REASON
/fabrics/cotton/jersey/180-gsm/	86	14	INDEX	High demand, deep supply, distinct specification
/fabrics/cotton/jersey/180-gsm/pakistan/	31	9	INDEX	Country genuinely affects price, MOQ and lead time
/buyers/t-shirt-manufacturers/cotton-jersey/	64	11	INDEX	Real buyer intent plus specific recommended-spec guidance

CANDIDATE PAGE	LISTINGS	SUPPLIERS	DECISION	REASON
/fabrics/cotton/jersey/185-gsm/	4	2	NOINDEX	Fails uniqueness — merge into the 180 GSM page as a variant
/fabrics/velvet/240-gsm/latvia/	0	0	NOINDEX	No demand, no supply, no reason to exist
/fabrics/cotton/jersey/?colour=navy	22	7	NOINDEX	Colour is a filter state, not a page — canonical to the parent
/fabrics/ramie/	2	1	NOINDEX	Below thresholds today; will auto-qualify if supply grows

NOINDEX IS NOT DELETION

Non-indexable pages still work for users: they are reachable through filters and internal search, they render normally, and they remain crawlable via `noindex, follow` so link equity flows through them. The only difference is that FabStitch is not asking search engines to treat them as a destination. The moment supply crosses the threshold, the nightly job flips them to indexable and adds them to the sitemap — no deployment, no manual review.

21

QUESTION

How should FabStitch avoid thin-content and duplicate SEO pages?

The explicit prohibitions, and what to do instead.

ANSWER

By treating page creation as a privilege that data earns, and by writing the prohibitions into the generator itself rather than relying on anyone's judgement at publication time.

NEVER DO THIS

- **Do not** create thousands of pages containing almost identical text with one or two words swapped
- **Do not** generate a page merely because a keyword combination exists in the database
- **Do not** keyword-stuff titles, headings, alt text, footers or hidden divs
- **Do not** create doorway pages — pages built only to catch a query and funnel the visitor elsewhere
- **Do not** spin AI text to pad an empty template
- **Do not** publish a category page with zero or one listing
- **Do not** create a page per colour, per city, or per trivial spec increment
- **Do not** let two pages target the same primary keyword

DO THIS INSTEAD

- **Use real supplier data** — company profiles, capabilities, capacity, certifications, locations
- **Use real listings** as the majority of every category page's substance
- **Use unique specifications** — GSM, yarn count, width, finish, test data differ genuinely between pages
- **Use meaningful buyer and application relationships** with real recommended specs and real trade-offs
- **Add information a buyer values** — MOQ norms, lead times, price bands, common failure modes
- **Index only valuable combinations**, per the Q20 gate
- **Consolidate** near-duplicates into one strong page with several entry keywords
- **Prune automatically** when a page falls below threshold

Six mechanical safeguards to build into the generator

SAFEGUARD	IMPLEMENTATION
Uniqueness scoring	Before publishing, compute similarity between the candidate page's rendered text and both its parent and its nearest siblings. Above 30% similarity, block publication and flag for merge.
Data-driven content blocks	The bulk of every page is generated from the actual listing set: GSM range present, price band, MOQ range, supplier count, countries represented, certifications available. This text differs between pages automatically because the underlying data differs.
Human-written intros for the head	The top few hundred pages by commercial value get hand-written introductions and FAQs. The long tail gets shorter, data-derived introductions — and is held to a stricter listing threshold to compensate.
Variant consolidation rules	Explicit rules in the generator: GSM values within 10 of each other merge to the nearest standard band; colour, pattern and print variants never generate pages; width variants only generate a page when they gate a whole use case, such as 240 cm+ for bedding.
Allowed-combination whitelist	Only these patterns may generate pages: fabric, fabric × construction, fabric × GSM, fabric × composition, fabric × certification, fabric × country, application, application × fabric, buyer, buyer × fabric, supplier, supplier × capability, listing. Everything else is a filter.
Continuous audit	A weekly report of indexable pages with zero clicks and zero impressions over 90 days, zero or one listing, or falling uniqueness scores. Pages on that report are merged, improved, or set to noindex — not left to accumulate.

THE PRINCIPLE UNDERNEATH ALL OF IT

Large-scale SEO works when the scale comes from **real marketplace data** rather than from text generation. FabStitch will have thousands of suppliers, tens of thousands of listings, and genuine expertise about which fabric suits which product. That is more than enough raw material for 40,000 substantive pages. The moment the site starts generating pages from templates instead of from inventory, it has stopped being a marketplace and started being a liability.

22

QUESTION

What are the highest-priority keyword groups?

Eight tiers, from broad head terms to certification and performance intent.

ANSWER

Tiers 1 and 2 describe the taxonomy; Tiers 3 to 8 are where the revenue is. Note that the tier number is a *structural* ordering — it describes how specific the query is, not the order in which FabStitch should chase them. Build priority runs roughly Tier 3 → 5 → 4 → 6 → 7 → 8 → 2 → 1, because specificity converts and head terms take years.

TIER 1

High-volume broad fabric terms

fabric · fabric supplier · cotton fabric · polyester fabric · knitted fabric · wholesale fabric

Enormous volume, mixed intent, dominated by established retailers and directories. Necessary for taxonomy and authority flow, but not a realistic early win.

TIER 2

Specific fabric types

french terry fabric · single jersey fabric · cotton interlock · ripstop nylon · cotton sateen · chenille upholstery fabric

Moderate volume, clearer intent, far less competition. These map one-to-one onto fabric pages and are the backbone of the taxonomy.

TIER 3

Wholesale & commercial intent

wholesale cotton fabric · bulk jersey fabric · fabric supplier for clothing brands · buy fabric by the roll · fabric price per kg · fabric exporter

Highest immediate priority. Unambiguously B2B, high value per visitor, and exactly what a marketplace is built to satisfy.

TIER 4

Application & product intent

fabric for t-shirts · best fabric for hoodies · fabric for scrubs · upholstery fabric for sofas · curtain fabric wholesale · swimwear fabric

Strong volume with genuine buying intent behind it. Often poorly served by pages with no inventory, which makes them winnable.

TIER 5

Specification intent

180 GSM cotton jersey · 240 GSM french terry · 12 oz denim fabric · 4 way stretch polyester spandex · 30s combed cotton · 280 cm wide bedsheet fabric

Lower volume, extremely high conversion. Anyone typing a GSM number is a professional mid- sourcing. Cheap to rank for and the highest ROI in the whole portfolio.

TIER 6

Buyer-specific intent

fabric for t-shirt manufacturers · fabric supplier for activewear brands · fabric for private label clothing · hotel linen fabric supplier · fabric for uniform manufacturers

Moderate volume, exceptional qualification — the searcher has already told you who they are and what they buy.

TIER 7

Location-specific intent

cotton fabric supplier Pakistan · fabric manufacturer Turkey · denim mill India · jersey fabric Portugal · textile supplier Bangladesh

Strong commercial intent from buyers with a sourcing-region strategy — often driven by duty, lead time or compliance requirements rather than price alone.

TIER 8

Certification & performance intent

GOTS certified organic cotton fabric · OEKO-TEX jersey supplier · GRS recycled polyester fabric · moisture wicking fabric supplier · flame retardant fabric manufacturer

Lowest volume, highest qualification. These buyers have a compliance requirement and a budget, and they are the least price-sensitive segment on the platform.

23

QUESTION

Which keywords are most valuable for FabStitch?

Search volume versus commercial value — and why they are almost inversely related.

ANSWER

The most valuable keywords are **not** the highest-volume keywords. In B2B fabric sourcing the relationship is close to inverted: as a query gets more specific its volume falls and its value rises, because specificity is evidence of a real buyer with a real order.

VOLUME VERSUS VALUE

KEYWORD	VOLUME	DIFFICULTY	INTENT	VALUE TO FABSTITCH	WHO IS TYPING IT
cotton fabric	Very high	Very high	Mixed	Low	Mostly consumers, students, hobby sewists
wholesale cotton fabric supplier	Medium	Medium	Commercial	Very high	A business buying in volume

KEYWORD	VOLUME	DIFFICULTY	INTENT	VALUE TO FABSTITCH	WHO IS TYPING IT
180 GSM cotton jersey supplier	Low	Low	Transactional	Exceptional	A sourcing manager who has finalised the spec
fabric for t-shirt manufacturers	Medium	Low–Medium	Commercial	Very high	A factory or brand entering production
wholesale denim fabric	Medium	Medium	Commercial	High	Denim brands and jeans manufacturers
sportswear fabric supplier	Low–Medium	Low	Commercial	Very high	Activewear brands with technical requirements
organic cotton fabric manufacturer	Medium	Medium	Commercial	Very high	Brands with a sustainability claim to substantiate
fabric supplier Pakistan	Medium	Low–Medium	Commercial	High	Importers and sourcing offices targeting the region
cotton jersey fabric Turkey	Low	Low	Commercial	High	European brands wanting short lead times
how to sew a t-shirt	Very high	Medium	Informational	None	Home sewists — not a FabStitch buyer at all

A prioritisation score worth implementing

KEYWORD PRIORITY SCORE

$\text{priority} = (\text{commercial_intent} \times 3) + (\text{supply_match} \times 2) + \text{volume_band} - (\text{difficulty} \div 20)$

- **commercial_intent** (1–5) — B2B purchase signals present in the query
- **supply_match** (1–5) — how well FabStitch's current listings satisfy the query; a high-value keyword with no supply behind it is a supplier-acquisition target, not an SEO target
- **volume_band** (1–5) — bucketed rather than raw, so a single huge head term cannot dominate the ranking
- **difficulty** (0–100) — divided down so it discounts rather than decides

Weighting commercial intent triple and supply match double encodes the core insight: FabStitch wins by being the best answer for queries where it has inventory and the searcher has a purchase order — not by competing for the largest number.

TWO SECONDARY CONSIDERATIONS

Supply-side keywords matter too. Queries such as `sell fabric online`, `B2B fabric marketplace for mills` or `list fabric for export` acquire suppliers. A marketplace with demand and no supply is worth nothing, so a slice of the portfolio — roughly 3–5% — should target the supplier side explicitly.

Informational keywords are a support act, not the show. A well-made GSM guide or a jersey-versus-interlock comparison earns links, builds topical authority, and captures buyers earlier than the transactional queries do. Keep them to a small, high-quality set inside `/resources/`, each linking clearly into the relevant fabric and application pages. They should never outnumber the commercial pages.

Keep a deliberate rejection list

Any volume-sorted keyword export will be dominated by retail and hobby queries. They belong in the keyword table marked `status = rejected`, with a reason — not deleted, because otherwise they get rediscovered and rebuilt every time someone new joins the project:

Ranking for these would inflate the traffic dashboard while adding nothing to the marketplace, and would pull FabStitch's topical signals away from B2B sourcing. Where such visitors do arrive, stating MOQs clearly and early filters them out quickly — which is a feature, not a leak.

How this translates into the FabStitch website

- **The build queue is a query, not a document.** Order the keyword table by score descending, filtered to rows where supply already exists, and build from the top.
- **Report inquiries per indexed page** rather than sessions per page. A specification page with 60 visits and four sourcing conversations is outperforming a guide with 4,000 visits.
- **Every keyword row names the one page responsible for it.** Enforced by the unique constraint on `primary_keyword_id`, so two pages never compete.
- **Re-score quarterly.** Supply depth changes as suppliers onboard, which changes which pages are worth building — the scoring model is a recurring job, not a one-off exercise.

24

QUESTION

What should the homepage communicate?

Positioning, the five seconds that matter, and a block-by-block homepage model.

ANSWER

The homepage has one message:

THE CORE PROMISE

Find the right fabric for what you're making.

Then, immediately underneath: *and the verified suppliers who can produce it at your quantity.*

That sentence works because it starts from the buyer's situation rather than the inventory. A manufacturer does not wake up wanting cotton — they wake up needing to produce 3,000 t-shirts at a target cost. "What you're making" is the language they already use, and it is also the exact axis the entire taxonomy in Q9 and Q10 is built on. The homepage and the data model say the same thing.

Catalogue versus discovery marketplace — the distinction that defines FabStitch

WHAT FABSTITCH IS NOT

A fabric catalogue

Organised by what sellers happen to have. The buyer must already know the exact fabric name to find anything. Success is measured in products listed. The buyer does the translation work from product to material, alone, using guesswork.

WHAT FABSTITCH IS

A fabric discovery and supplier marketplace

Organised by what buyers are making and the constraints they are under — quantity, budget, certification, lead time, origin. Success is measured in qualified sourcing conversations. FabStitch does the translation from product to specification.

THE HOMEPAGE'S SEO JOB IS NOT TO RANK FOR FABRIC TERMS

It will rank for the brand and for a small set of terms like B2B fabric marketplace and fabric sourcing platform. Its real SEO function is **link distribution**: it is the strongest page on the domain, and the hubs it links to inherit that strength. Which is why blocks 3, 4, 5, 8 and 9 exist — they are the top of the internal linking graph, not decoration. Trying to make the homepage rank for cotton fabric would compete with the cotton hub, which is a page that can actually satisfy the query.

The five seconds

A production manager arriving from a search result decides almost immediately whether to continue. Above the fold, the homepage must answer four things at once:

- **What is this?** A B2B marketplace for sourcing fabric from verified suppliers — stated plainly, not implied by imagery.

- **Is it for me?** Wholesale quantities, MOQs shown openly, buyer types named explicitly. A hobbyist should be able to tell within seconds that this is not a fabric shop.
- **Is there anything here?** Live counts — listings, verified suppliers, countries, materials. Real numbers, drawn from the database, no rounded marketing figures.
- **How do I start?** The discovery selector from Q25, in the hero, working immediately — not a search box that requires the buyer to already know the fabric name.

MESSAGING TO AVOID

- "Wide range of quality fabrics at competitive prices"
- "Your one-stop textile solution"
- "World-class fabrics from leading manufacturers"
- Hiding MOQ and pricing behind a signup wall
- A bare search box with no idea of what to type into it
- Lifestyle photography with no specifications visible

MESSAGING THAT WORKS

- "Find the right fabric for what you're making"
- "Source knits and wovens from verified mills — from 300 kg"
- "Filter by GSM, composition, MOQ and certification"
- MOQ and price bands visible on every listing card
- A selector that starts from the product, not the material
- Real fabric detail shots with the specification beside them

Homepage block model

#	BLOCK	CONTENT	PURPOSE
1	Hero + discovery selector	The core promise headline, one supporting line, and the three-step selector: <i>I make · I need · quantity</i>	Positioning and immediate action in the same viewport
2	Live marketplace proof	Listing count, verified supplier count, countries, material families — computed, not hard-coded	Credibility; answers "is there real supply here"
3	Start with what you make	10–14 application tiles: t-shirts, hoodies, shirts, activewear, uniforms, bedding, upholstery, bags	The primary entry path, and strong internal links to application hubs
4	Browse by fabric	12–16 top material families with live listing counts	Serves buyers who already know the material; links to fabric hubs
5	Built for buyers like you	6–8 buyer types with a one-line description each	Self-identification, and links into the buyer taxonomy
6	How sourcing works	Three or four steps: search → compare specifications → request samples → order	Removes process uncertainty for first-time marketplace buyers
7	Why buyers trust FabStitch	Supplier verification, specification accuracy, sample process, certification checks, MOQ transparency	The objection-handling block — trust is the real conversion barrier in B2B sourcing
8	Certifications	OEKO-TEX, GOTS, GRS, BCI with listing counts behind each	Compliance-driven entry path; links to certification hubs
9	Sourcing by country	8–12 countries with supplier counts and a line on what each is known for	Origin-led entry; links to country hubs

#	BLOCK	CONTENT	PURPOSE
10	For suppliers	A distinct, clearly separated band inviting mills to list	Supply-side acquisition without diluting the buyer message
11	Resources	Three or four genuinely useful guides — GSM, MOQ negotiation, certification basics	Top-of-funnel capture and topical authority signals
12	Footer	Full category map: fabrics, applications, buyers, countries, certifications	Sitewide link distribution to every major hub

The hero, written out

A worked example of blocks 1 and 2, so there is no ambiguity about tone or specificity:

ABOVE THE FOLD

Find the right fabric for what you're making.

Source knits and wovens from verified mills — filter by GSM, composition, MOQ and certification, and request samples before you commit. Orders from 300 kg.

Selector: I make [T-shirts ▼] · I need [Cotton jersey ▼] · Quantity [500 kg] → **Find suppliers**

Secondary link: I already know my specification →

Proof strip: 4,120 live listings · 260 verified suppliers · 14 countries · OEKO-TEX, GOTS, GRS

Every number in that strip is read from the database at render time. If a figure is not yet impressive, the honest number still builds more trust with a sourcing professional than a rounded claim — and it gives the team a visible reason to keep onboarding suppliers.

Note what the hero does *not* do: it does not ask the buyer to name a fabric before helping them, it does not hide MOQ behind a login, and it does not lead with adjectives. A production manager can tell within one screen whether FabStitch can serve them — which is exactly the qualification FabStitch wants to happen as early as possible.

25

QUESTION

What should the fabric discovery experience look like?

The selector, the filter set, the result card, and why this is the differentiator.

ANSWER

Discovery is where FabStitch either becomes indispensable or becomes another directory. The design principle is that **a buyer should be able to describe their situation, not name a product** — and get a usable shortlist from it.

The three-step selector

The first question is deliberately *"what are you making?"* and not *"what fabric do you want?"*. That single choice is the whole product thesis: it lets FabStitch serve the buyer who knows their product but not their material — which is most small brands, most private label buyers and most designers. The buyer who already knows they want 180 GSM combed cotton jersey can skip straight to step two, and the selector should never force them through step one.

Filter set

FILTER	CONTROL	SOURCE FIELD	NOTES
Application	Single select	application_id	Drives which fabrics are offered next

FILTER	CONTROL	SOURCE FIELD	NOTES
Fabric / construction	Multi-select tree	fabric_category_id · construction_id	Constrained to valid combinations
Composition	Multi-select + %	composition jsonb	"At least 95% cotton" style ranges, not just exact matches
GSM	Range slider + preset bands	gsm	Presets labelled by use: tee-weight, hoodie-weight
Width	Range + type toggle	width_inches · width_type	Tubular vs open width matters for cutting yield
MOQ	Range, "show only ≤ my quantity"	moq_value · moq_unit	The highest-value filter on the platform
Price band	Range	price_min · price_max · price_unit	Normalised to a common unit for comparison
Country	Multi-select	country_id	Grouped by region, with lead-time implication shown
Certification	Multi-select	listing_certifications	Hard requirement for compliance-driven buyers
Stretch	Toggle + direction	stretch_pct · stretch_direction	2-way / 4-way is a decisive spec for activewear
Finish · dye · pattern	Multi-select	finish[] · dye_method · pattern	Secondary; collapsed by default
Performance	Multi-select	attributes jsonb	Wicking, water resistance, UV, antibacterial, FR
Lead time · samples · stock	Toggles	lead_time_days · sample_available · stock_status	"Sample available" converts browsers into buyers
Supplier	Toggle	verification_status	Verified-only view

What every result must show

A sourcing decision needs enough information to shortlist without opening ten tabs. Each result card carries: material and construction · GSM with tolerance · width and width type · composition · finish · MOQ with unit · price band per unit · lead time · certifications · country and supplier name with verification state · sample availability · and two actions — *request sample* and *add to inquiry*. Multi-select across results into a single RFQ is what turns discovery into a sourcing workflow rather than a search engine.

Search intelligence that has to exist for this to feel good

CAPABILITY	BEHAVIOUR
Query parsing	A buyer typing 180 gsm combed cotton jersey 72 inch into the search box has it decomposed into GSM, quality tier, composition, construction and width filters — with the parsed facets shown as removable chips so they can see what was understood

CAPABILITY	BEHAVIOUR
Alias handling	Lycra and spandex both resolve to elastane; loopback, loop knit and French terry resolve to one construction; sweatshirt fleece and brushed back fleece unify. Aliases live in the taxonomy tables, not in the search index
Unit conversion	GSM ↔ oz/yd ² , inches ↔ cm, and kg ↔ linear metres derived from GSM and width — so a buyer thinking in metres can filter inventory priced in kilos
Tolerance-aware matching	A search for 180 GSM returns 175–185 GSM as close matches, clearly labelled, because mills work to tolerance and an exact-match-only result set looks empty when it is not
Never dead-end	Zero results relaxes the least critical constraint and says so — "no 180 GSM organic jersey in Portugal; 12 results in Turkey, 8 at 190 GSM in Portugal" — and always offers to post the requirement to suppliers as a sourcing request

Why this is the differentiator

EXISTING OPTION	HOW THE BUYER MUST SEARCH	WHAT BREAKS
Trade directories	By supplier name or broad category	Returns companies, not specifications. The buyer emails twenty mills and waits
Mill websites	By that mill's own product names	No comparison possible; no MOQ visibility until contact
Retail fabric stores	By fabric name, in metres	Wrong quantities, wrong pricing, no production support
Trade shows and agents	By relationship	Works, but slow, expensive and inaccessible to small brands
FabStitch	By what they are making, at their quantity, to their specification	Nothing — this is the gap

DISCOVERY FEEDS THE SEO ENGINE — THIS IS THE LOOP THAT MATTERS

Every search performed on FabStitch is keyword research that no competitor has access to.

- **Frequent filter combinations become page candidates.** If 400 buyers filter cotton jersey + 180 GSM + Pakistan in a quarter, that page is justified by first-party demand data — stronger evidence than any keyword tool.
- **Zero-result searches become a supply roadmap.** They say precisely which suppliers to recruit next, and which country × fabric pages will be buildable once recruited.
- **Search terms with no taxonomy match reveal gaps** in the fabric, application or alias tables.
- **Inquiry-to-view ratios per page** tell you which programmatic pages are genuinely working, which is the only signal that should drive further page generation.

ONE IMPLEMENTATION WARNING

Faceted search and indexable pages must be kept structurally separate. Filter interactions live in query parameters and stay out of the index (Q18); the combinations proven worth ranking for get promoted into clean canonical paths by the page-generation job (Q20). Letting the filter UI generate crawlable URLs directly is the most common way marketplaces accidentally publish hundreds of thousands of near-duplicate pages — the exact outcome this document exists to prevent.

SECTION 3 — FINAL RECOMMENDATION

Recommended FabStitch SEO & marketplace architecture

Everything in this document reduces to one data model and one relationship chain. Build those correctly and the pages, the navigation, the filters and the keyword targets all fall out of them. Build them incorrectly and every page has to be maintained by hand.

The architecture in one view

FABSTITCH — TEN ENTITIES, ONE SYSTEM

FabStitch

- **Buyers** — 12 main categories, ~120 subcategories · who is sourcing, and what they make
- **Applications** — ~90 end products · the bridge between buyer intent and specification
- **Fabrics** — ~40 families, ~350 nodes across three levels · material, construction, quality tier
- **Specifications** — ~25 filterable fields · GSM, width, composition, stretch, finish, MOQ, price
- **Suppliers** — verified mills, converters and traders · capability, capacity, MOQ policy, lead time
- **Listings** — the atomic unit · every page on the site is an aggregate of these
- **Countries** — sourcing origins · qualifies supply, drives location intent
- **Certifications** — OEKO-TEX, GOTS, GRS, RCS, BCI, bluesign · compliance filter and trust signal
- **Keywords** — 50,000+ row planning database · research and prioritisation layer; not a page list
- **Programmatic SEO pages** — generated, gated, monitored · the output of the model, never the input

The relationship that carries the whole system

THE CORE CHAIN

Every page type in this document is a slice through that chain. A fabric page is the chain entered at *fabric*. A buyer page is the chain entered at *buyer*. A country × fabric page is two points on the chain held fixed while the rest varies. A listing page is one complete traversal. This is why the page architecture does not need to be designed page by page — it is the same relationship read from different starting points.

WHY THIS MODEL SUPPORTS 30,000–40,000 PAGES WITHOUT BECOMING THIN

The page count is not produced by multiplying keyword lists together. It is produced by **real listings accumulating against real taxonomy nodes**. Each new supplier that onboards with 40 listings across 6 materials and 3 GSM bands makes a handful of previously below-threshold pages viable, and deepens dozens of existing ones. Page count therefore grows as a function of supply — which is exactly the behaviour that keeps quality constant as scale increases. Reaching 40,000 pages is evidence that the marketplace filled up, not evidence that a generator was run.

Suggested build sequence

Planning figures for sizing and sequencing. Each phase's page targets assume the supply thresholds in Q20 are actually met — pages are not published to hit a number.

PHASE	FOCUS	INDEXABLE PAGES	WHAT MUST BE TRUE BEFORE MOVING ON
Phase 0 Foundation	Taxonomy, schema, URL rules, slug registry, listing template, indexability job	~50	Taxonomy signed off; listing form captures every field in Q8; page_stats job running nightly
Phase 1 Hubs	Fabric families and constructions, top applications, primary buyer subcategories — all hand-written	~400	Every hub has ≥5 listings from ≥3 suppliers; internal linking complete; no orphan hubs
Phase 2 Depth	Specification pages, buyer × fabric and application × fabric cross-cuts, supplier profiles	~3,000	Near-duplicate detection live; specification commentary library built; first rankings and inquiries measurable
Phase 3 Breadth	Country × fabric, certification hubs, performance pages, remaining buyer subcategories	~8,000	Genuine supplier depth in each country published; certification claims verified
Phase 4 Scale	Listing pages at volume, long-tail specification bands, resources and guides	~30,000+	Continuous: page count follows listing count, gated by the same thresholds throughout

The ten decisions this document is asking for

#	DECISION	RECOMMENDATION
1	Primary organising axis	Application — "what are you making" — with fabric as the secondary axis
2	Buyer taxonomy depth	12 main categories, ~120 subcategories, subcategories flat in the URL
3	Keyword database vs pages	50,000+ keyword rows; a few thousand indexable pages. Never one page per keyword
4	Initial keyword targets	5,000–15,000 mapped targets, prioritised by score not volume
5	URL depth limit	Four levels maximum; anything deeper is a filter, not a page
6	Facets in the index	Never. Clean paths only, promoted from proven filter combinations
7	Indexability control	Computed nightly from listing and supplier counts; not editable by hand
8	Content investment	Top ~200 pages hand-written; assisted below; data-assembled at the tail
9	Success metric	Inquiries per indexed page — not sessions, not page count
10	Growth driver	Supplier onboarding. Supply depth is what unlocks new indexable pages

Before build begins — what to validate

Nothing in this document should be treated as settled until it has been checked against real data. Six checks, in this order, before engineering time is committed:

- 1 Run keyword research against the tier model.** Pull volumes for a sample of 200–300 keywords spread across all eight tiers in Q22. The absolute numbers matter less than confirming the *shape* — that specification and buyer-intent queries exist at all, and that wholesale modifiers behave as expected in FabStitch's target markets.
- 2 Audit supply against the taxonomy.** For every proposed Phase 1 hub, count the listings and suppliers currently available. This immediately reveals which hubs are buildable now and which are supplier-recruitment targets — and it is the difference between a real launch plan and a wishlist.
- 3 Confirm the listing form captures every filterable field in Q8.** Any field missing at listing time can never be filtered, faceted or used for page generation later without re-contacting every supplier. This is the single most expensive thing to get wrong.
- 4 Agree the standard bands.** GSM bands, width options, MOQ units and price units must be fixed vocabularies before the first listing is created. Free-text specification values make programmatic pages impossible.
- 5 Put the Q20 thresholds in configuration, not in code.** They will be tuned repeatedly in the first year as indexation data arrives, and tuning must not require a deployment.

- 6 Instrument from day one.** Internal search queries, zero-result searches, filter combinations and inquiries per page are the data that drives every later decision about which pages to build. Retrofitting this instrumentation means losing the first year of evidence.

What "working" should look like

Page count is the wrong measure of progress, so the reporting has to be set up around different numbers. These are the four that indicate the architecture is doing its job:

MEASURE	WHY IT IS THE RIGHT SIGNAL	UNHEALTHY PATTERN
Share of indexable pages that receive at least one inquiry per quarter	Proves pages are reaching buyers who can act, not just accumulating impressions	A large indexed footprint where a small minority of pages produce every inquiry — the rest are filler and should be demoted or merged
Ratio of indexed pages to pages submitted in sitemaps	A direct read on whether search engines consider the generated pages worth keeping	A widening gap — the signal that generation has outrun genuine supply and content depth
Zero-result searches as a share of all searches	Measures the gap between what buyers want and what suppliers have listed	A stable or rising share, meaning supplier recruitment is not following real demand
Listings per taxonomy node in Phase 1 hubs	The underlying driver of everything else; supply depth is what unlocks new indexable pages	Page count growing faster than listing count — the clearest early warning of thin content

If those four move in the right direction, the 30,000–40,000 page target will arrive on its own, as a by-product of a marketplace that filled up. If they do not, adding pages will make the position worse rather than better — which is the reason every rule in this document is written as a gate rather than a target.

SECTION 4 — THE SYSTEM IN ONE PAGE

FabStitch: from search query to supplier

One buyer, one query, one path through the architecture.

Read downwards, that is a buyer's journey. Read as a data structure, it is the schema from Q19. Read as a URL, it is `/fabrics/cotton/jersey/180-gsm/pakistan/`. Read as a keyword, it is a tier 5 and tier 7 query with high commercial intent and low difficulty. Every layer of FabStitch — the navigation, the filters, the page templates, the database, the keyword plan — is the same chain expressed in a different form. That alignment is what makes the system maintainable at 40,000 pages, and what makes each page genuinely useful rather than merely present.

The engine works in both directions. Downwards, it converts a search query into a shortlist of suppliers who can actually produce what the buyer needs. Upwards, every search performed, every filter combination used and

every inquiry sent tells FabStitch which pages to build next and which suppliers to recruit — so the marketplace and its search visibility grow from the same data.

IN SUMMARY

Build the marketplace properly, and the SEO is a consequence of it.

FabStitch should not aim to publish 40,000 pages. It should aim to hold enough real, well-structured, well-specified supply that 40,000 useful pages become possible — and then let the indexability rules decide, every night, which of them have earned a place in the index.

Every number in this document is a planning figure for sizing and sequencing. Validate keyword volumes against research tools, validate thresholds against FabStitch's own indexation and inquiry data, and treat the taxonomy as a living structure that supplier onboarding and buyer search behaviour will continue to reshape.
